Remote Viewing: Inner Vision, Outer Knowledge

A Companion to the Scry Training App

By Malychite · Oct 27, 2026 · @DM Abledsoul

How to Use This Book with Scry

This book is the companion to **Scry**, a blind remote viewing training app. The book explains the why and the how; the app gives you the targets, the timer, the tools and the record of every session you run. Read a chapter, then go and do what it describes in the app the same day.

Each practical chapter ends with a short **In the App** box that names the screen or feature it matches, and a **Practice** exercise you can do in one sitting. You can read straight through, or jump to Part II and start viewing on your first night.

Part	What it covers	Where it lives in Scry
I. Foundations	What remote viewing is, its real history, your mind as the instrument, how to prepare	Protocol Guide, Ambient Player, Breathing Guide
II. The Protocol	The blind coordinate, Stage 1 ideograms, Stage 2 senses, analytical overlay	Session screen, Sketchpad, Descriptor grid
III. Feedback	The reveal, self-rating, Judge Mode, reading your own numbers	Reveal screen, Stats
IV. Beyond the Coordinate	Other states of mind, dreams, group viewing, the spiritual path, ethics	Technique log, Dream Journal, Circles, Daily Target, Malychite Guides
V. Training	A 30-day program and where to go next	Achievements, streaks
Appendices	Descriptor reference, session log, achievements, glossary, reading list	Everything

You need three things: the app, a quiet room, and stereo headphones for the binaural soundscapes. A paper notebook helps too, because some of the best insights arrive after you have closed the screen.

A Note from Malychite

I did not come to remote viewing as a scientist. I came to it as a seeker, the way many of you will, curious about whether the mind can reach farther than the eyes. What kept me practicing was not belief. It was the discipline of the protocol itself: a sealed target, a blank page, and an honest reveal that tells you, every single time, how you did.

That honesty is the heart of this book and of the app. Remote viewing has a fascinating history and a hotly argued scientific record. People of good faith disagree about what it is and whether it works. I will not ask you to take a side on faith. I will ask you to practice carefully, record everything, and let your own results speak.

There is a spiritual dimension here as well, and I will not pretend otherwise. Sitting in stillness and reaching toward something unknown changes you, whatever the scores say. You learn to quiet your inner chatter, to notice subtle impressions, and to tell the difference between what you perceive and what you assume. Those are skills worth having on any path.

So welcome. Breathe. Open the app. Your first coordinate is waiting.

Malychite

Part I: Foundations

Before you sit with your first coordinate, you need to know what you are attempting, where the practice came from, and how to prepare the one instrument remote viewing uses: your own mind. Part I covers all three.

Chapter 1: What Remote Viewing Is

Remote viewing is the practice of describing a target you cannot see, cannot reach, and have been told nothing about. The target might be a mountain, a temple, a bridge or a lonely stretch of ocean. You receive only a meaningless code. You then record whatever impressions arise, and only afterward do you learn what the target was.

That last step is what separates remote viewing from daydreaming. A daydream has no answer key. A remote viewing session always does. You find out, every time, how close you came.

Scrying, old and new

The word *scry* is old English, from *descry*: to catch sight of something distant or hidden. For thousands of years people scried with tools. They gazed into still water, polished obsidian mirrors, crystal spheres or candle flames, hoping images would rise up out of the surface. The oracle at Delphi, the seer with a bowl of water, the shaman on a spirit journey all chased the same idea: that the mind can reach past the body's senses.

Modern remote viewing keeps that ancient aim but changes the method. Instead of a crystal ball, it uses a protocol. Instead of trusting whatever vision appears, it demands a hidden target and an honest comparison afterward. You could call it scrying with a scorecard.

What remote viewing is not

It helps to clear away some confusion early.

- **It is not guessing.** A guess asks "what is it?" and jumps to a name. Remote viewing deliberately avoids naming and records raw sensations instead: cold, rough, rising, wet, humming.
- **It is not mind reading.** In a proper session no one nearby knows the target either. That is what "double-blind" means, and it matters (Chapter 5).
- **It is not fortune telling.** Viewers do sometimes report impressions of a target's future feedback, which Chapter 12 explores. But the core practice is describing a fixed target, then checking.
- **It is not proven, and it is not disproven.** The research record is real, long and contested. Chapter 2 tells that story straight, so you can make up your own mind.

Coordinate or Controlled? A note on names

You will see the letters **CRV** everywhere. They first stood for **Coordinate Remote Viewing**, because the earliest experiments at Stanford Research Institute gave viewers map coordinates as their only cue. Later, when the method was refined into a staged protocol and taught to military viewers, the name shifted to **Controlled Remote Viewing**. Both names refer to the same family of technique. This book uses CRV for the structured method and "remote viewing" for the practice in general.

The four promises of a good session

Every session you run in Scry, and every exercise in this book, keeps four promises. They are what make remote viewing a discipline rather than a hunch.

1. **The target is hidden.** You know nothing about it before you finish.
2. **The impressions are raw.** You record what you sense, not what you think it is.
3. **The record is fixed.** Once you submit, your impressions cannot be edited to fit the answer.
4. **The feedback is honest.** You see the real target and judge yourself fairly, including the misses.

If any of these four slip, a session can feel wonderful and teach you nothing. Keep all four and even your failures become data.

Why practice at all?

People come to remote viewing for different reasons. Some want to test, carefully and personally, whether non-local perception is real. Some treat it as a meditative discipline that sharpens attention. Some see it as one part of a wider spiritual path that includes astral travel, dreamwork and energy practice. Many simply find it fascinating.

All of these are good reasons, and the practice supports each of them. Even a viewer who never beats chance comes away calmer, more observant and more honest with themselves about the gap between perception and assumption. Those gains are real whatever you conclude about the rest.

What the training looks like

The path in this book follows the path in the app:

1. **Settle** your body and mind with breath, sound and stillness.
2. **Receive** a blind coordinate.
3. **Catch** the first reflex mark, the ideogram.
4. **Describe** raw sensations across the senses.
5. **Quarantine** the names and guesses your mind throws up.
6. **Reveal** the target, rate yourself, and test yourself against decoys.
7. **Record** everything, and look for patterns over weeks.

None of these steps is hard on its own. Doing them in order, honestly, again and again, is the whole art.

> **In the App:** Tap **Protocol** in the top bar for a one-screen summary of the CRV method. Keep it open the first few times you view.

> **Practice:** Before your first session, write one paragraph in your notebook answering: *Why am I doing this, and what would convince me it works, or doesn't?* Date it. You will come back to it on Day 30.

Chapter 2: A Short, Honest History

Remote viewing has two histories. One is very old: the long human story of seers, oracles and scrying mirrors. The other is very new and very specific: about twenty-three years of government-funded research in the United States, from 1972 to 1995. Knowing both will make you a better viewer, and a harder one to fool.

The seers before the science

Nearly every culture has kept some practice of seeing at a distance. Siberian and Amazonian shamans described spirit journeys to find lost animals, distant relatives or the cause of an illness. The Greeks travelled to Delphi to hear the Pythia speak. Tibetan practitioners used polished mirrors and still water. In Elizabethan England, the scholar John Dee and his partner Edward Kelley gazed into a polished obsidian mirror, brought from Mexico, hoping for visions. That mirror survives today in the British Museum.

These traditions shared a method: quiet the mind, focus on a surface or a symbol, and wait for images. What they lacked was a way to check. A vision of a far-off place was judged by how meaningful it felt, not by comparing it with the place itself.

Early experiments in the twentieth century

The first steps toward testing came between the world wars. In 1930 the novelist Upton Sinclair published *Mental Radio*, describing hundreds of trials in which his wife, Mary Craig Sinclair, tried to draw pictures he had made in another room. Some of her sketches matched strikingly; many did not. Sinclair simply laid them all out side by side, hits and misses together.

At Duke University in the 1930s, J. B. Rhine ran card-guessing experiments and popularized the term *extrasensory perception*. In France, René Warcollier studied how telepathic images arrive in fragments, shapes and impressions rather than whole pictures. That observation, that the signal comes in pieces, would shape remote viewing decades later.

Stanford Research Institute, 1972

Modern remote viewing began in 1972 at Stanford Research Institute (SRI) in Menlo Park, California. Two laser physicists, **Harold "Hal" Puthoff** and **Russell Targ**, started a small program studying psychic perception, with early funding from the CIA. The Cold War was the backdrop: reports suggested the Soviet Union was researching psychic phenomena, and U.S. agencies did not want to be left behind.

Their first star subject was **Ingo Swann**, a New York artist who is usually credited with coining the phrase "remote viewing." Swann pushed for a radical cue: instead of a person standing at the target, the viewer would get only a pair of geographic coordinates. This became known as Coordinate Remote Viewing, and later the basis for the Controlled Remote Viewing protocol.

Another early subject was **Pat Price**, a retired police commissioner. In 1974, given only coordinates, Price described a Soviet facility at Semipalatinsk in Kazakhstan and sketched a giant gantry crane running on rails. Satellite photographs later showed a crane with a broadly similar design. Supporters still cite this case. Critics point out that much of Price's description of the site was wrong, and that a few vivid hits among many misses are exactly what chance can produce.

That tension, striking hits alongside many misses, runs through the whole history. Keep it in mind.

The military program, 1978 to 1995

In the late 1970s the U.S. Army set up its own unit of viewers at Fort Meade, Maryland, trained partly in methods developed at SRI. Over the years the program changed hands and names many times: Gondola Wish, Grill Flame, Center Lane, Sun Streak, and finally **Stargate**, the name most people know.

The most famous of its viewers is **Joseph McMoneagle**, an Army intelligence officer known as Remote Viewer No. 001. In 1979 he was asked to describe a building in the Soviet Union. He reported a huge submarine under construction, larger than anything known, with angled missile tubes, inside a hall far from water. Some months later, satellite images showed a new Typhoon-class submarine being launched from a facility at that location. It remains one of the most cited cases in the field.

The program also produced stranger material. A declassified 1984 session, widely attributed to McMoneagle, described Mars a million years ago: pyramids, very tall people, and a dying world. It is a reminder that remote viewing records sometimes drift far beyond anything that can be checked. Hold such sessions with wonder and with care: a target that can never be checked can never show you whether you were right.

Meanwhile, research continued at SRI and, from the mid-1980s, at a defense contractor called SAIC under physicist Edwin May. These laboratory studies, run with tighter controls than the operational unit, are where most of the scientific evidence comes from.

The 1995 review and the end of Stargate

In 1995 the CIA commissioned the American Institutes for Research to evaluate the whole program. Two experts reviewed it.

- **Jessica Utts**, a statistician, concluded that the laboratory results showed effects too large to be explained by chance and that psychic functioning had been demonstrated statistically.
- **Ray Hyman**, a psychologist and long-time skeptic, disagreed. He argued the results might stem from flaws in the experiments not yet found, and that no one had a theory or a reliably repeatable effect.

Both agreed on one thing: in all its years, remote viewing had never produced intelligence reliable enough for officials to act on alone. The program was closed that year. Thousands of pages of its records were later declassified and remain open to the public.

Why this history matters to you

It is tempting to tell this story as a triumph ("the government proved it") or as a scandal ("the government wasted millions on psychics"). Neither is honest. The fair summary is this:

1. Serious scientists studied remote viewing for over two decades.
2. Some results were striking and have never been fully explained.
3. The effect, if real, was weak, unreliable and hard to use.
4. The debate about what the data mean is still open.

That leaves you in an exciting position. You do not have to trust Puthoff, Targ, Utts or Hyman. You can run the experiment yourself, under the same basic conditions they used: a blind target, a fixed record, and comparison against chance. Scry is built to let you do exactly that.

Lessons the pioneers left us

Whatever you think of the results, the pioneers discovered practical truths that every viewer can use:

- **The signal arrives in fragments.** Shapes, textures, temperatures and feelings come first. Whole, named pictures usually come from imagination.
- **The naming mind is the enemy of accuracy.** Swann called its interference *analytical overlay*, and built his protocol to catch it (Chapter 8).

- **Structure helps.** A fixed sequence of stages keeps the viewer from wandering into storytelling.
- **Feedback trains you.** Viewers who saw their targets afterward seemed to improve; those who never got feedback did not.
- **Blind means blind.** Even a monitor who knows the target can leak clues by tone of voice. The best studies kept everyone in the room ignorant.

Every one of these lessons is built into the chapters that follow, and into the app.

> **In the App:** Open **Guides** to read *Anatomy of the Stage 1 Ideogram* and *Quenching Analytical Overlay*, which expand on Swann's two biggest contributions.

> **Practice:** Read one primary source from the Further Reading list (Appendix E), even a few pages. Note one claim you find convincing and one you doubt, and say why.

Chapter 3: The Instrument

A telescope needs a clean lens. In remote viewing the lens is your nervous system, and the dirt on it is mental noise: worry, plans, chatter, the endless naming of things. This chapter is about the state of mind you bring to a session, the sound tools that can help you reach it, and the six techniques Scry asks you to log.

The noisy mind and the quiet signal

Practitioners describe the impressions they work with as faint. They arrive as a passing coolness, a flicker of colour, a sense of height, a sound at the edge of hearing. On an ordinary busy day these are easily drowned out, the way starlight vanishes in a lit city.

So the first skill is not perception at all. It is quieting. You are trying to reach a state that is relaxed but awake, receptive but not drifting into sleep. Every tradition that works with inner perception, from meditation to shamanic drumming, aims at some version of this state.

Brainwave states, in plain terms

Your brain's electrical activity rises and falls in rhythms that can be measured from the scalp. Researchers group them into bands, roughly as follows.

State	Frequency	What it feels like	Use in practice
Gamma	about 30 Hz and up	Intense focus, sudden insight	Short bursts of clarity; experimental
Beta	about 13 to 30 Hz	Normal alert thinking, problem solving, talking	Everyday waking; too busy for viewing
Alpha	about 8 to 12 Hz	Calm, eyes-closed relaxation, light reverie	Structured CRV sessions
Theta	about 4 to 8 Hz	Deep meditation, the drowsy edge of sleep, vivid imagery	Ideograms, imagery, astral and hypnagogic work
Delta	below about 4 Hz	Deep, dreamless sleep	Rest and recovery, not viewing

Treat these as a map, not a law. Your brain mixes several rhythms at once, and the boundaries vary between sources. What matters for practice is the direction of travel: from busy Beta toward relaxed Alpha, and sometimes deeper into Theta, without losing awareness.

Binaural beats

A binaural beat is a simple trick of hearing. Play one steady tone in your left ear and a slightly different tone in your right. Say 200 Hz on the left and 206 Hz on the right. Your brain combines them and you hear a soft pulsing at the difference, here 6 pulses per second. That pulse exists only inside your head; it is produced by the way the brainstem compares sound from the two ears.

Many meditators find that listening to a beat in the Theta or Alpha range helps them settle faster. Some studies report changes in mood, anxiety and attention; others find little effect, and scientists still debate whether binaural beats truly pull brainwaves into step or simply relax people. The honest advice is: try them, log whether you used them, and let your own session results tell you if they help.

Two practical rules apply:

- **Use stereo headphones.** Speakers mix the two tones in the air and the effect disappears.
- **Keep the volume low.** The tones should sit at the edge of hearing, not dominate it.

Scry's Ambient Player offers four presets:

Preset	Beat	Intended use
Theta	6 Hz	Stage 1 trance, astral and imagery work
Alpha	10 Hz	Relaxed, focused CRV sessions
Delta	2.5 Hz	Deep physical rest before or after practice
Gamma	40 Hz	Short experiments with peak alertness

A good beginner routine is ten minutes of Alpha before a CRV session. Once you are comfortable, try Theta on alternate days and compare your results.

The six techniques Scry tracks

Remote viewing is not one technique. Before each session, Scry asks which approach you are using, so that over time you can see which one works best for you. Here is what each option means.

1. **CRV (Controlled Remote Viewing).** The structured, staged protocol at the heart of this book. You stay grounded and alert, move through ideogram and sensory stages, and flag analytical overlay as it arises. Best for beginners and for disciplined record keeping.
2. **Astral Projection / OBE.** Rather than receiving fragments, you aim to shift your sense of location itself and "travel" to the target, experiencing it as if present. More immersive, harder to control. Chapter 11 covers it in depth.
3. **Meditation / Quiet Float.** A softer approach. You meditate with the coordinate in mind and simply note whatever surfaces, without formal stages. Good for days when structure feels forced.
4. **Ideogram First Reflex.** A stripped-down drill that concentrates on the very first movement of the hand when the coordinate appears. Useful for training speed and trust.
5. **Hypnagogic State.** Viewing at the drowsy border of sleep, where imagery is vivid and spontaneous. Powerful, but you risk falling asleep or dreaming instead of perceiving.
6. **Binaural Beat Entrainment.** Any session where sound is the main tool for reaching the receptive state. Logging it separately lets you compare sound-assisted sessions with silent ones.

You are not choosing a religion. Most viewers use CRV as their backbone and experiment with the others. The point of logging is to replace opinion with evidence about your own mind.

Your baseline matters

Alongside the technique, Scry records two more facts about each session: how many minutes you meditated beforehand, and the time of day. These seem minor. Over fifty sessions they can be revealing. Some viewers discover they score better at dawn; others find that more than fifteen minutes of meditation makes them sleepy and vague. You cannot discover these patterns unless you record them honestly from the start.

> **In the App:** Open the **Ambient Player** from the top bar to choose a binaural preset. On the session screen, fill in the **Session Method** bar (technique, meditation minutes and time of day) before you view.

> **Practice:** Listen to the Alpha preset with headphones for ten minutes, eyes closed, without viewing. Afterward, write three words describing your state. Repeat with Theta the next day and compare.

Chapter 4: Preparing to View

A session lasts perhaps fifteen minutes. The ten minutes before it often decide how it goes. This chapter gives you a simple, repeatable preparation ritual: the space, the breath, the body, the timing and the intention.

Set the space

Choose one place and use it every time. Repetition teaches your body that this chair, this lamp, this hour means "we are viewing now."

- **Quiet.** Silence your phone and put it face down, or in another room if you use a tablet or computer for the app.
- **Light.** Soft and indirect. Bright overhead light keeps you alert in the wrong way; darkness invites sleep.
- **Posture.** Sit upright with both feet on the floor and your hands free to draw. Lying down is for hypnagogic work only.
- **Temperature.** Slightly warm. A cold room pulls your attention back to your body.

- **Materials.** Your device with Scry open, headphones, and a notebook and pen beside you.

Some viewers add a candle, a stone or a small object that carries meaning for them. These are not required, but a consistent ritual object can become a useful cue for the mind.

Breathe

Breath is the quickest lever you have on your nervous system. Slow breathing, especially with long exhales, shifts the body away from alertness and toward rest. Scry's Breathing Guide offers three patterns, each paced with a soft chime.

Box breathing (4-4-4-4). Used by athletes and military personnel to stay calm under pressure. It steadies you without making you sleepy, which makes it ideal right before CRV.

1. Inhale slowly through the nose for 4 seconds.
2. Hold gently, shoulders relaxed, for 4 seconds.
3. Exhale steadily through the mouth for 4 seconds.
4. Rest in the empty stillness for 4 seconds.

Repeat for 4 to 8 rounds.

4-7-8 relaxation. A deeper release, useful when you arrive at practice tense or wound up.

1. Inhale quietly through the nose for 4 seconds.
2. Hold the breath with calm awareness for 7 seconds.
3. Exhale fully through the mouth, with a soft whoosh, for 8 seconds.

Four rounds is plenty. If you feel light-headed, return to normal breathing.

Body scan. A guided sweep from head to toe that releases tension and then widens your awareness beyond the room.

1. **Crown and brow** (6 seconds): soften the forehead, the eyes and the jaw.
2. **Throat and shoulders** (6 seconds): let the shoulders drop away from the ears.
3. **Chest and core** (6 seconds): soften the belly; feel the heartbeat slow.
4. **Hands and feet** (6 seconds): notice warmth and tingling at your extremities.
5. **Non-local horizon** (8 seconds): let awareness expand past the walls, as if the room has no edges.

That last step is the bridge into viewing. You are not imagining the target yet. You are simply letting go of the boundary of your own space.

Choose your time

Scry asks you to log one of four windows:

Window	Hours	Notes
Dawn	5:00 to 8:00	The mind is fresh and quiet; many traditions favor it
Day	8:00 to 17:00	Convenient, but the busiest mental state
Dusk	17:00 to 21:00	A natural winding down; good for beginners
Night	21:00 to 5:00	Deep and imaginative, with more risk of drowsiness

There is no correct window. There is only your window, and you find it by logging honestly and comparing results after a few weeks.

How long to meditate

Scry records your meditation minutes before each session. Start with five to ten minutes. Less, and you may still be carrying the day with you. Much more than twenty, and many people drift toward sleep. As with time of day, let your own numbers guide you.

Set an intention, not an expectation

Just before you begin, hold a simple intention: *I will describe the target for this coordinate.* That is all. Do not hope it is something beautiful. Do not tell yourself you must score well. Expectation is a form of noise; it creates pictures before any signal arrives.

The singing bowl chime that marks the start of a session is a good anchor for this moment. Let its sound fade completely, and begin.

When focus will not come

Some days the mind will not settle. Thoughts loop, the body itches, the room is too loud. This is normal and it is not failure. Try one of these:

- Do one extra round of 4-7-8 breathing, then begin anyway.
- Switch technique to **Meditation / Quiet Float** and lower your expectations for the day.
- Run the session regardless and log honestly. Your stats will later show how much a scattered state costs you, which is valuable knowledge.

- Or simply skip viewing and practice breathing only. A streak matters less than a healthy relationship with the practice.

Ground yourself afterward

Viewing can leave you slightly spacey, especially after Theta or hypnagogic work. Before you return to daily life, close the loop: place both feet on the floor, drink a glass of water, stretch, and say aloud the date and where you are. Occasionally a session stirs up emotions or memories. Write them in your notebook and let them be. If something persistent or distressing comes up, talk to someone you trust; this practice is not a substitute for professional support.

The pre-session checklist

- [ ] Phone silenced, space set
- [ ] Headphones on, preset chosen (optional)
- [ ] Breathing pattern completed
- [ ] Body scan to the non-local horizon
- [ ] Technique, meditation minutes and time of day logged
- [ ] Intention set, chime faded

> **In the App:** The **Breathing** tab paces all three patterns with a chime at each phase. The **Ambient Player** includes the singing bowl chime and the binaural presets.

> **Practice:** For three days, run only the preparation ritual, with no viewing. Notice how quickly you settle on Day 3 compared with Day 1.

Part II: The Protocol

This is the working heart of the book. Part II walks through a session from the moment the coordinate appears to the moment you submit your impressions, one stage per chapter, in the order you will meet them in the app.

Chapter 5: The Blind Coordinate

Every Scry session begins with a short code, something like **K7Q-294**. The code is the only thing you are given. It tells you nothing about the target, and that is the whole point.

What the code is, and is not

The code is randomly generated: three characters, a dash, then three digits. Letters that are easily confused, such as I and O, and the digits 0 and 1, are left out, so every code is easy to read and copy. There is no hidden pattern to decode. A code starting with K is no more likely to be a mountain than one starting with Z.

So why use a code at all? There are two ways to understand it, and you may hold either or both.

- **The practical view.** The code is a label that lets you aim your attention at one specific target while giving your thinking mind nothing to work with. A photograph or a place name would hand your imagination a head start. A code hands it nothing.
- **The intuitive view.** Many practitioners describe the code as an address. When you hold the intention to describe *the target for this code*, the code becomes a thread that your deeper awareness can follow, the way a name can call a person's face to mind.

Either way, treat the code with respect. Write it at the top of your notes. Say it silently once. Then let it go and wait.

Single-blind and double-blind

In a **single-blind** session, you do not know the target, but someone near you does. That person can leak clues without meaning to: a pause, a hopeful tone, a glance at a picture. Early researchers learned the hard way that even honest monitors cue viewers.

In a **double-blind** session, no one who can influence you knows the target either. When you view alone with Scry, the app picks the target at random and keeps it hidden until you submit. Nobody in the room knows. That is double-blind practice, the same standard serious studies aimed for.

Your part in keeping it blind is simple: **do not look**. Do not open the app's code, browse its target library, or read lists of its targets online. This book deliberately does not list them. Once you know the pool, every session becomes a multiple-choice guess, and your results stop meaning anything.

The three tiers

Scry sorts its targets into three tiers of difficulty. You choose the tier before you begin.

Tier	Name	What the targets are like	What it trains
T1	Famous	World-famous landmarks with strong, distinctive features	Confidence, and catching analytical overlay
T2	Obscure	Real but little-known places, often strange or remote	Describing without the help of memory
T3	Vectors	Bare coordinates for remote, featureless or unusual spots	Pure sensory description, no landmarks

It is natural to assume Tier 1 is easiest. In one way it is: famous places have bold shapes, colours and settings, which give you plenty to perceive. In another way it is the hardest. Your mind already holds a picture of every famous landmark, so the moment you sense "tall and metal," your memory offers you a postcard. Tier 1 is where you learn to resist that pull.

Tier 2 removes the postcard. You cannot match an impression to a place you have never heard of, so you are forced to stay with raw description.

Tier 3 goes further still. Many of these targets are oceans, deserts or rifts with almost nothing manmade to latch onto. Descriptions like *wet, open, cold wind, nothing tall* are often the most accurate you can give. Tier 3 teaches the hardest lesson in remote viewing: that a short, plain, true description beats a rich, detailed, imagined one.

A sensible progression is two weeks mostly at T1, then mixing in T2, then occasional T3 sessions. The 30-day program in Chapter 16 follows this curve.

The Daily Target

Scry also offers a **Daily Target**. Each day, one coordinate and target are chosen by the date itself, so every Scry user worldwide receives the same code. The target is still hidden until you submit.

The Daily Target has a special feel. You are viewing alongside others, possibly at the same moment, and afterward you can compare notes with friends in a Viewing Circle (Chapter 13). It is also a gentle way to build a daily habit, since the day's code is already waiting for you.

Opening the session

Here is the first minute of every session, step by step.

1. Complete your preparation ritual (Chapter 4).
2. Choose your tier.
3. Log your technique, meditation minutes and time of day.
4. Read the code once, slowly. Write it at the top of your notes.
5. Let the chime fade. Settle your gaze softly on the code.
6. Move straight into Stage 1 (Chapter 6): your pen should touch the page within a second or two.

Resist the urge to think about the code, to wonder what it might be, or to hope for a particular kind of target. Those thoughts are the beginning of analytical overlay. The code is a doorway, not a riddle.

A note on repeats

Scry's target pool is finite, and it avoids giving you the same target twice in a row. Over many sessions, though, you will meet some targets more than once. If you ever feel certain that you recognize a target from an earlier session, write that down as an overlay (Chapter 8) and continue describing. Recognition from memory is not perception, and your honest notes will help you tell the difference.

> **In the App:** The **Session** screen shows the code, the tier selector (T1, T2, T3) and the Session Method bar. **Daily** opens today's shared coordinate.

> **Practice:** Run three T1 sessions this week. Before each, write the code by hand and sit with it for ten seconds without thinking about it. Notice how often your mind tries to guess.

Chapter 6: Stage 1, the Ideogram

The ideogram is the first mark your hand makes when you meet the coordinate. It takes a second or two. It looks like a scribble. And it may carry the purest impression you will receive all session, because it arrives before your thinking mind has time to interfere.

A seismograph, not a drawing

Think of the ideogram as a seismograph needle rather than a sketch. A seismograph does not draw a picture of an earthquake; it records the shudder. In the same way, your hand does not draw the target in Stage 1. It records the jolt of first contact as motion.

Ingo Swann believed this first motion comes from below conscious thought, the body answering before the mind can ask "what is it?" Many teachers in the esoteric traditions would put it differently: the hand is the servant of the deeper self, and it moves before the ego can take control. Both descriptions point to the same practical rule. **Be fast. Don't think. Let the hand go.**

The three parts of an ideogram

A complete ideogram has three parts, and you capture all three in a few seconds.

1. **The stroke.** The mark itself, made within one to two seconds of looking at the code. One continuous movement is ideal.
2. **The feel.** As your hand moves, notice what the motion was like. Was it smooth or jagged? Did it rise, fall, curve, loop or run flat? Was there resistance, as if pressing on something hard, or did it flow?
3. **The first word.** Say or write the first word that comes for the *motion*, not the object: *flat, rising, wavy, curved, angular, spiky*. Then, separately, a first answer for the *kind* of thing: land, water, structure, mountain, life, motion, air.

The first word must be quick and plain. "Rising, hard, structure" is perfect. "I think it is a tower in Europe" is no longer an ideogram; it is analytical overlay (Chapter 8).

Common ideogram families

Over years of practice, viewers have noticed that certain kinds of targets tend to produce certain kinds of strokes. These are not rules. Your own ideograms will develop their own personality. But they are a useful starting vocabulary.

Stroke	Typical feel	Often associated with
A flat horizontal line	Steady, even, no resistance	Flat land, plains, deserts, open ground
A soft wavy line	Flowing, rolling, fluid	Water: sea, lake, river
Up, across and down, like a hill	Rising then falling, solid	Mountains, hills, peaks

Stroke	Typical feel	Often associated with
A sharp vertical, often with an angle	Hard, rigid, deliberate	Manmade structures, towers, buildings
An arch or a dome curve	Rounded, enclosing	Domes, arches, bowls, craters
Steps or a zigzag	Stop-start, tiered	Terraces, stairs, stepped buildings
A loop or spiral	Turning, energetic	Motion, wind, vortex, life or activity
A tangled scribble	Busy, many directions	Cities, crowds, forests, complexity

Some targets combine features, and your hand may combine strokes: a wavy line that rises into a sharp vertical, for example, might suggest a structure beside water. Note what you feel and move on. Do not interpret yet.

Building your personal ideogram dictionary

The most powerful thing you can do in your first month is to build your own dictionary. After every session, once the target is revealed, look back at your ideogram and ask: *what part of the target did this stroke catch?*

You will start to see patterns. Perhaps your water always comes out as a hook rather than a wave. Perhaps your structures begin with a little tick before the vertical. These personal signatures matter more than any table in a book. Keep a page in your notebook titled **My Ideograms**, and add a small sketch and a note each time you recognize one.

Repeat and confirm

Many CRV teachers ask the viewer to take two or three ideograms in a row. Write the code again, make another quick mark, feel it, name it. If your strokes keep returning to the same shape, that is a sign of a strong impression. If they differ wildly, the target may be complex, or you may be tense. Either way, note it without judging.

Using the Sketchpad

Scry's Sketchpad is a blank canvas for your ideogram and for any rough shapes that come later in the session.

- **Draw with a finger or stylus, quickly.** The ideogram should take one to two seconds. Do not tidy it.
- **Do not render.** If you find yourself carefully drawing windows, waves or individual stones, you have left Stage 1 and started imagining. Stop, breathe, and move on to Stage 2.
- **Leave room.** Make the ideogram in one corner. Later impressions of shape or layout can go elsewhere on the canvas.
- **Do not erase.** An honest record includes the messy marks. Your first stroke is evidence; keep it.

When you complete three sessions with sketches, Scry awards the **Ideogram Kinematics** badge. Let it remind you that the hand, not the eye, opens the session.

Common mistakes

- **Waiting too long.** A deliberate mark made after five seconds of thinking is a drawing, not an ideogram. Speed is the point.
- **Drawing what you hope for.** If you secretly want a pyramid, your hand will make a triangle. Notice the wish and set it aside.
- **Over-reading.** One stroke cannot tell you the whole target. It is a first clue, not a verdict.
- **Skipping it.** Some beginners jump straight to descriptors. You lose the earliest and least filtered impression of the session.

A teacher's note

In my own tradition we teach that the hand is a bridge between worlds. In ritual, the athame or wand directs energy before words can follow. The ideogram is the remote viewer's version of that gesture: a moment where the body acts on knowledge the mind has not yet put into words. Treat that moment with respect. It is small, and it is sacred.

> **In the App:** On the **Session** screen, the **Sketchpad** opens beside the code. Make your ideogram there first, before touching any descriptor.

> **Practice: the ideogram drill.** Ask a friend to choose ten photographs, put each in a sealed envelope, and number the envelopes. For each one, look at the number, make an ideogram in under two seconds, and write your motion word and kind word. Open the envelopes only after all ten. Start your ideogram dictionary from the results.

Chapter 7: Stage 2, the Senses

After the ideogram, you slow down and open your senses one at a time. This is Stage 2, and it rests on one question that every viewer must learn to ask instead of the natural one.

Do not ask: *What is it?*

Ask: *What is it like?*

Why sensations, not names

A name is a conclusion. The moment you decide "it's a cathedral," your imagination supplies spires, stained glass and organ music, whether or not any of it is there. A sensation is a single, small piece of data: *cool*, *hollow echo*, *grey*, *very tall*. Sensations can be checked one by one against the target, and most importantly they do not drag a whole imaginary picture along behind them.

The early researchers noticed that their viewers' sensations were often accurate even when their guesses were wildly wrong. A viewer might say "a lighthouse" when the target was a smokestack, but also "tall, round, grey, wind, near water," which was right in every detail. Stage 2 is the art of keeping the true details and letting go of the false conclusion.

The sensory channels

Move through these channels slowly. Give each a few breaths. Write down anything that comes, even a single word, and pass over any channel that stays silent.

Channel	Questions to ask yourself	Example impressions
Temperature	Is it warm, cold, hot, damp, dry?	*chilly, baking, humid*
Texture	What would it feel like to touch?	*rough, smooth, gritty, slick*
Sound	What can I hear, or not hear?	*roaring, humming, echo, silence*
Smell and taste	Anything in the air or on the tongue?	*salt, dust, smoke, sulphur, pine*

Channel	Questions to ask yourself	Example impressions
Light	Bright or dim? Direct or diffuse?	*glare, shadowed, glittering*
Colour	What tones dominate?	*sand gold, deep blue, rust red*
Dimension	How big? How high, wide, deep?	*vast, towering, narrow, sunken*
Motion	Is anything moving?	*flowing, still, spinning, crowds*
Atmosphere	What is the feeling of the place?	*sacred, busy, lonely, ancient*

That last channel, atmosphere, is where many intuitive people are strongest. The "feel" of a site, its age, its reverence, its isolation, often comes through clearly even when its physical shape does not. Swann called the strongest version of this *aesthetic impact*: a sudden wave of awe, fear or delight in response to the target. If you feel one, write it down at once.

Writing your impressions

Scry gives you a free text field for this stage. Keep entries short and separate: one impression per line or phrase, not sentences that tell a story.

A good Stage 2 record looks like this:

> *cold · wind · high up · open sky · grey and white · hard underfoot · something very old · quiet · sense of looking down a long way*

A record that has slipped into storytelling looks like this:

> *I'm standing on a mountain in the Alps and there's a monastery with monks singing.*

The first can be checked word by word. The second is a single guess dressed up as a vision.

The descriptor grid

Once you have written your raw impressions, Scry offers a grid of **descriptors**: ready-made labels sorted into seven groups. Selecting them turns your impressions into a form the app can compare with the target. The descriptors also act as prompts, reminding you of channels you may have skipped.

Here are the seven groups and what each one asks.

1. Water and Maritime Presence. *Is water part of this place?* Options: Water Present; Ocean / Sea; River / Canal / Waterfall; Coastal / Shoreline; Island / Surrounded; Purely Landlocked / Dry. Water is one of the most frequently perceived elements, and one of the most important to get right. Notice whether you feel spray, hear surf, or sense a dry stillness.

2. Terrain and Environment. *What is the land like?* Options: Desert / Arid Dunes; Mountains / High Elevation; Canyon / Ravine / Gorge; Valley / Plain; Lush Forest / Tropical; Urban / Dense Cityscape; Vertical Cliffs / Precipice.

3. Structure Type and Archetype. *Is something built here, and what kind of thing?* Options: Tower / Spire / Minaret; Bridge / Spanning Arch; Pyramidal / Ziggurat; Temple / Cathedral / Sacred; Dome / Rotunda / Cupola; Amphitheater / Arena / Oval; Colossal Statue / Figure; Fortress / Wall / Bastion; Pure Natural Formation; Modern Skyscraper / High-Tech. This is the group most open to analytical overlay. Choose only what you feel as a shape, not what you have guessed as a place.

4. Geometry and Dominant Lines. *What shapes and lines stand out?* Options: Triangular / Pointed; Arched / Vaulted; Curved / Circular / Spherical; Linear / Long Horizontal; Extreme Vertical Ascent; Tiered / Stepped Terraces; Asymmetric / Irregular. Your ideogram often speaks here. Look back at it before you choose.

5. Substances and Materials. *What is it made of?* Options: Hewn Stone / Masonry; Iron / Steel / Metal; Polished Marble / White Stone; Sandstone / Red Earth / Rock; Glass / Reflective Paneling; Snow / Ice / Frozen; Raw Soil / Terracotta / Clay. Texture and temperature impressions feed this group.

6. Colour Impressions. *What colours dominate?* Options: Golden / Amber / Sand; Red / Terracotta / Russet; Deep Blue / Azure / Teal; Pure White / Pale Alabaster; Granite Grey / Metallic; Emerald / Forest Green; Dark / Charcoal / Shadowy.

7. Scale and Atmosphere. *How big is it, and how does it feel?* Options: Massive / Monumental / Colossal; Serene / Still / Meditative; Ancient / Millennia-Old Aura; Windy / Exposed / High-Altitude; Bustling / Human Convergence; Sacred / Reverent Weight; Remote / Isolated / Silent.

How to choose descriptors well

The grid holds 49 options. It is tempting to tick many of them to improve your chances. Don't. Scry's match score rewards **precision**: most of its weight goes to how many of your chosen descriptors are correct, and a smaller share to how much of the target you covered. Ticking everything waters your accuracy down.

Good practice:

- **Choose from your notes, not from the grid.** Each descriptor you select should trace back to an impression you actually wrote. If you can't point to the line in your notes that supports it, leave it out.
- **Fewer and confident beats many and hopeful.** Five well-founded descriptors are better than fifteen maybes.
- **Avoid contradictions.** If you select both *Ocean / Sea* and *Purely Landlocked / Dry*, one of them is noise.
- **Use the free text for nuance.** If you feel "shallow, warm, turquoise water," select *Water Present* and *Deep Blue / Azure / Teal*, and keep the nuance in your notes. Your self-rating will reward it later even when the grid cannot.
- **Let silence count.** If no structure came through at all, consider *Pure Natural Formation*, or select nothing in that group. An empty group is honest.

Sensing as a spiritual discipline

The Hermetic tradition teaches that *as above, so below; as within, so without*. Stage 2 is that principle in practice. You turn attention inward, to sensations that seem to rise from nowhere, and you test them against the outer world. Over time, viewers often find this changes how they move through ordinary life: they notice textures, temperatures and atmospheres they would once have walked past. Inner vision trains outer awareness, and outer feedback refines inner vision.

> **In the App:** The **Session** screen has a free-text impressions box and the seven-group **Descriptor** grid, with a counter showing how many you have chosen per group. Fill the text box first.

> **Practice: one channel a day.** For a week, devote each session to a single channel in depth. Monday temperature, Tuesday sound, Wednesday texture, and so on. Write at least five impressions in that channel before touching any other. After the reveal, note which channel was most accurate for you.

Chapter 8: Analytical Overlay

At some point in nearly every session, a picture will flash into your mind, complete and confident: *It's the Eiffel Tower. It's a lighthouse. It's Stonehenge.* That flash has a name. It is **analytical overlay**, or AOL, and learning to handle it is the single biggest step in becoming an accurate viewer.

What AOL is

Your mind hates a blank. When it receives a few fragments, *red, metal, high up, sea wind*, it immediately searches its memory for something that fits and offers you the best match: *the Golden Gate Bridge!* This is not a fault. It is exactly what the mind evolved to do, filling in gaps so you can recognize a friend's face across a crowded room.

In remote viewing, though, the match is usually wrong. The fragments may have come from a red crane in a harbour, an offshore oil rig, or a painted radio mast on a cliff. If you accept "Golden Gate Bridge" as the answer, you will spend the rest of the session inventing cables, fog and traffic, and every invented detail pulls you further from the real target.

Swann noticed this pattern in his earliest sessions and gave it a name. AOL, he taught, is not the enemy. It is simply the analytical mind doing its job at the wrong moment. The skill is not to stop it, which is impossible, but to **catch it, label it, and set it aside**.

How to declare AOL

The procedure is simple, and you should follow it every time, without exception.

1. **Notice.** The moment a name or a complete picture appears, recognize it for what it is.
2. **Write it down.** In your notes, write "AOL:" followed by the image. *AOL: Golden Gate Bridge.* Writing it releases its grip.
3. **Box it.** Draw a box around it, on paper or in your mind. It is quarantined: present in the record, but not part of your description.

4. **Return.** Look back at the code, breathe, and ask the Stage 2 question again: *What is it like?*

That's all. You do not argue with the AOL, and you do not feel bad about it. You honour it by recording it, and then you go back to work.

The kinds of AOL you will meet

Type	What it sounds like	Where it comes from
Memory AOL	"It's that beach I went to as a kid."	A personal memory that matches a sensation
Famous-place AOL	"It's the pyramids."	Postcard images, especially on Tier 1
Wish AOL	"I hope it's somewhere beautiful."	Expectation and desire
Fear AOL	"It feels dangerous, maybe a war zone."	Anxiety colouring a strong impression
Peer AOL	"Someone else said water, so..."	Group sessions where impressions are shared too early
Repeat AOL	"This is the same one as last week."	Memory of earlier targets in a small pool

Knowing the type helps you let go of it. A memory AOL, for instance, is usually a sign that some *sensation* matched your memory, so ask yourself which sensation that was and write it down on its own.

AOL as a clue

Here is the part beginners miss: AOL often contains real signal, wrapped in the wrong package. If you write "AOL: lighthouse," the target may well be tall, round and near water, just not a lighthouse.

So after you box an AOL, do one more thing. Ask: *what about this image felt right?* Then write those qualities as plain Stage 2 impressions.

> *AOL: lighthouse → tall · cylindrical · white · sea air*

Those qualities can be checked and can earn their place in your descriptors. The name cannot.

When AOL won't leave

Sometimes one image keeps returning, again and again, crowding out everything else. CRV teachers call this an **AOL drive**. When it happens:

- Write it down once more, clearly, and box it.
- Take a short break: put the pen down, close your eyes, breathe three slow breaths.
- Re-read the code and make a fresh ideogram, as if starting over.
- If it still persists, finish the session with what you have. Note "AOL drive" in your reflection. You will learn from it at the reveal.

Other breaks are useful too. If a sudden wave of feeling hits you, write "AI:" for aesthetic impact and describe the feeling, then pause before continuing. If you feel completely lost, write "confusion" and take a breath. Naming the state is half the cure.

Using AOL in Scry

Scry's impressions box is the right place to record your AOLs. Start each one with "AOL:" so you can find it easily later. When you choose descriptors, **never select one based only on an AOL**. If you wrote "AOL: pyramid" but never felt anything triangular or ancient, leave *Pyramidal / Ziggurat* unticked.

At the reveal, look back at your AOLs. Over time you will learn how your particular mind dresses up its signals. Some viewers find their AOLs are surprisingly often "right family, wrong member": a cathedral instead of a mosque, a bridge instead of a dam. That knowledge is gold.

The ego and the inner eye

In spiritual terms, AOL is the voice of the little self, the part of us that needs to be clever, to know, to be right. Every mystical path teaches some way of quieting that voice so a deeper knowing can speak. In Hermetic language, AOL is the lower mind rushing to name what the higher mind has only begun to perceive. Declaring it is a small act of humility: *I do not yet know what this is. I will keep listening.*

Practise that humility in your sessions and you may find it spreading into the rest of your life.

> **In the App:** Type your AOLs into the **impressions** box beginning with "AOL:". The Guides library has a full article: *Quenching Analytical Overlay: The Art of Declaring AOL*.

> **Practice: the AOL harvest.** After your next five sessions, list every AOL you declared. Beside each, note the target and whether the AOL shared any real quality with it. Count how many were "right family, wrong member."

Part III: Feedback

The reveal is where remote viewing becomes a practice rather than a pastime. Part III covers the moment of truth, the three ways Scry measures a session, and how to read your own record over weeks and months.

Chapter 9: The Reveal

You have made your ideogram, written your impressions, declared your overlays and chosen your descriptors. Now you press submit, and the target is unveiled. Many viewers say this is the most important minute of the whole session, and the early researchers agreed: **feedback is what trains you.**

Why feedback matters so much

Imagine learning archery in the dark. You loose arrow after arrow and never see where they land. You would never improve. Feedback turns each session into a lesson: this impression was right, that one was imagination, this AOL was the right family but the wrong member.

There is a deeper idea here too. Some researchers and many practitioners believe the viewer is partly perceiving the *moment of feedback itself*, the photograph they are about to see, rather than the distant place. If that is so, honest and attentive feedback is not just the end of a session; it is part of the signal. Chapter 12 returns to this idea through dreams.

Either way, the rule is the same. **Never skip the reveal, and never rush it.**

Three ways of measuring

Scry evaluates each session three different ways. Each one sees something the others miss.

Measure	Who judges	What it tells you	Its weakness
Judge Mode	You, blind, choosing among four photos	Whether your record picks out the real target better than chance	Needs many sessions to mean much
Match score	The app, comparing descriptors with the target's tags	How precisely your chosen descriptors fit	Cannot read your notes, sketches or metaphors
Self-rating	You, after seeing the target	Whether the session truly captured the place, in your honest judgment	Open to wishful thinking

Taken together they give a fair picture. Taken alone, each can mislead.

Judge Mode: the blind test

Judge Mode is the most rigorous of the three, and it comes first. Scry shows you four photographs: the real target and three decoys, in random order. You look back over your own recorded impressions, sketch and descriptors, and choose the photo they fit best.

If you chose by pure chance, you would pick the right one one time in four, or **25%**. That is the chance baseline, and it is the number to beat. A single hit means little. A hit rate well above 25% over many sessions starts to mean a great deal (Chapter 10).

To keep Judge Mode honest:

- **Judge before you look at the reveal.** Make your choice using only your record and the four photos. Do not scroll ahead to the answer.
- **Judge your record, not your feeling.** Ask which photo best matches what you actually *wrote and drew*, not which one you now feel drawn to.
- **Look for specifics.** If your notes say "water, cold, tall, grey," a stormy coastal tower fits better than a desert ruin, however beautiful the ruin is.
- **Accept the result.** A decoy pick is not a failure. It is an honest data point, and honest data points are what make your hits meaningful.

Your first hit earns the **Decoy Breaker** badge. Three hits earns **Tri-Judge Superiority**.

The match score

Next, Scry compares your chosen descriptors with a set of hidden tags describing the target, and produces a percentage. It recognizes close relatives, so choosing *Water Present* for an ocean target still counts.

The score weights **precision** most heavily: about two-thirds depends on how many of your descriptors were correct, and one-third on how much of the target you covered. It then gives a verdict:

Score	Verdict
65% and above	Strong match
30% to 64%	Partial match
Below 30%	No match

The match score is useful for one thing above all: it shows you which *kinds* of descriptor you get right. Over time you may notice that your colours are reliable but your structures are not, or that you nearly always perceive water correctly. That tells you where to trust yourself and where to slow down.

Remember its limits. The score cannot read your free text, see your sketch, or understand a metaphor. A session where you wrote "a giant stone bowl, people all around" for an amphitheater may score modestly if you missed the matching descriptors, and still be an excellent piece of viewing. Scores of **70%** and **85%** earn the **Resonance Surge** and **Holographic Fidelity** badges.

The self-rating: your honest verdict

Finally, you rate the session yourself: **Yes**, **Partially** or **No**. Did your impressions genuinely capture this target? You can also add reflection notes.

Scry treats your self-rating as the canonical measure, because only you can judge the meaning of your own impressions, the echoes, metaphors and sensations no algorithm can weigh. That trust is a responsibility. Rate as if a strict, kind teacher were looking over your shoulder.

- **Yes** means the main features of the target clearly came through: its setting, its dominant shape or material, its feel. Not every detail, but the heart of it.
- **Partially** means some real correspondences alongside significant misses or overlay.
- **No** means you cannot honestly point to meaningful correspondence.

When in doubt, rate lower. Five honest "Yes" ratings earn **Canonical Resonance**, and they are worth far more than twenty generous ones.

Reading the reveal well

When the photograph appears, slow down. Do not just look for hits. Work through your record line by line.

1. **Look at the whole picture first.** Let the place land in your senses before you analyse anything.
2. **Check the ideogram.** What part of the target did your first stroke catch? Add it to your ideogram dictionary.
3. **Go through your impressions.** Mark each one: right, close, wrong, or can't tell.
4. **Review your AOLs.** Did any share a real quality with the target?
5. **Notice the surprises.** Was anything you dismissed actually there? Write it down. These are often your most important lessons.
6. **Write a reflection.** Two or three lines: what worked, what misled you, what you will try next time.

Handling hits and misses

A strong hit can be thrilling. Enjoy it, and then record it as soberly as a miss. A run of misses can be discouraging. Remember that even the most celebrated viewers in history had long runs of misses, and that a miss honestly recorded is the ground your future hits stand on.

Most of all, guard against the temptation to bend the facts. "I said water, and there's a tiny fountain in the corner, so that's a hit" is a habit that will quietly ruin your record. Let the misses be misses.

A sacred moment

In ritual we close the circle; we do not just walk away. The reveal is the closing of the session's circle. The question you sent out is answered, and the answer, whatever it is, deserves your full attention. Many viewers take a moment of gratitude here, for what they

perceived, for what they missed, and for the lesson in both.

> **In the App:** After you submit, the **Reveal** screen opens with **Judge Mode** at the top. Choose your best fit first; then review the target, the match score, and your self-rating and reflection notes.

> **Practice:** For your next ten sessions, write your reflection *before* looking at the match score. Then compare: did your own reading of the session agree with the app's?

Chapter 10: Reading Your Own Data

One session is a story. Fifty sessions are a record. This chapter teaches you to read that record the way a researcher would, so that you can see your real strengths, your real progress, and the conditions under which your inner vision works best.

What the Stats screen shows

Scry keeps every session you complete and summarizes them on the **Stats** screen.

Stat	What it means
Total sessions	Every session you have submitted
Self-ratings	How many you rated Yes, Partially, No, or left unrated
Accuracy	Your self-ratings combined: each Yes counts fully, each Partially counts half
Average match score	The mean of the app's descriptor scores across all sessions
Daily streak	Consecutive days with at least one session
Top perceived categories	The descriptor groups you choose most often
Judge Mode hit rate	Hits divided by judged sessions, shown against the 25% baseline

Stat	What it means
Method breakdown	Sessions and average match score for each technique you logged

Each of these answers a different question. Accuracy asks *how do I rate myself?* The match score asks *how precise are my descriptors?* The Judge Mode hit rate asks the hardest question: *is my perception picking out the real target more often than luck would?*

Understanding chance

The 25% baseline is your anchor. With four photos to choose from, pure guessing would pick the right one about one time in four. So if your hit rate is above 25%, you are doing better than chance... but only if you have enough sessions for that to mean something.

Think of flipping a coin. Three heads in a row happens all the time. Thirty heads in forty flips would make you suspect the coin. The same is true of Judge Mode: a few lucky hits early on are easy to get, and a high rate over many sessions is not.

Here is a simple guide. The last column shows the number of hits that would happen by luck alone less than about one time in twenty, a common threshold scientists use for "probably not just chance."

Judged sessions	Hits expected by chance	Hits to be notable	As a hit rate
10	2 or 3	6 or more	60%
20	5	9 or more	45%
30	7 or 8	13 or more	43%
50	12 or 13	19 or more	38%
100	25	33 or more	33%

Notice the pattern: the more sessions you have, the closer to 25% a notable hit rate can be. A steady 35% over a hundred sessions says more than 60% over five. That is why patience and honest logging matter more than any single dazzling session.

Scry marks your record as "above chance" as soon as your hit rate passes 25%. Treat that as encouragement, not proof. Use the table above to judge when your result becomes truly striking.

Finding your best conditions

The real treasure in your data is not one number but the comparisons. After twenty or thirty sessions, look for patterns.

- **Technique.** The method breakdown shows your average match score for each technique. Perhaps CRV gives you 48% while Quiet Float gives you 31%. Or perhaps the reverse. Trust the numbers over your preferences.
- **Time of day.** Review your sessions by the window you logged. Many viewers discover a clear favourite.
- **Meditation length.** Compare sessions after five, ten and twenty minutes of preparation.
- **Tier.** Your T1 results will usually look stronger, partly because famous places have bold features. Compare T2 and T3 with each other over time.
- **Descriptor groups.** Which groups do you choose most, and which ones match most often? Some viewers are strong on terrain and weak on colour; others the reverse.

Make one change at a time. If you switch technique, time of day and preparation all in the same week, you will never know which change helped.

Self-honesty checks

Numbers can flatter. Every few weeks, run these checks.

1. **Compare self-rating with Judge Mode.** If you rate many sessions "Yes" but your Judge Mode hit rate stays near 25%, your self-ratings may be too generous.
2. **Count unrated sessions.** Leaving disappointing sessions unrated quietly inflates your accuracy. Rate them all.
3. **Look at your misses.** Are there patterns? Perhaps you always see water when there is none. That is a known bias you can now watch for.
4. **Re-read old reflections.** Do they still agree with what you see in the photos?

Streaks and rhythm

Scry tracks your daily streak and rewards it: **Harmonic Cadence** at 3 days, a 5-day badge, **Solar Octave** at 7 and **Fortnight Alignment** at 14. Daily practice builds a rhythm that many viewers find essential. The Hermetic principle of rhythm teaches that everything flows in tides, and practice is no different: short, regular sessions build skill far better than occasional marathons.

But a streak is a servant, not a master. If you are ill, exhausted or upset, rest. One missed day costs you a badge. Forcing poor sessions costs you the honesty of your record.

Keep your record safe

Scry stores your sessions in your own browser, on your own device. That keeps them private, but it also means clearing your browser data or changing devices could erase them. Use the **Export** button on the Stats screen regularly to download a backup file of your logbook, and **Import** it to restore your record on a new device. Think of it as copying your sacred journal: it represents months of work.

> **In the App:** The **Stats** screen shows all of the measures above, plus your achievements and full session history. Tap any past session to review its reveal. Use **Export** and **Import** to back up your logbook.

> **Practice: the monthly review.** On the last day of each month, sit down with your Stats screen and notebook for half an hour. Write down your Judge Mode hit rate, your best technique, your best time of day, and one bias you noticed. Choose one thing to change next month.

Part IV: Beyond the Coordinate

The protocol is the backbone of practice, but it is not the whole body. Part IV opens the wider view: the spiritual philosophy that makes sense of non-local perception, the other states of consciousness that reach for the same truth, dreams, group work, and the ethics that keep it all clean.

Chapter 11: The All Is Mind

The question everyone eventually asks is: *how could this possibly work?* How can a mind in one city describe a cliff in Ireland it has never seen? Science has no settled answer. But the mystery schools have offered one for thousands of years, and it is worth knowing, because it changes how you hold your practice.

The Hermetic tradition

Hermeticism takes its name from Hermes Trismegistus, "thrice-great Hermes," a legendary sage blending the Greek god Hermes with the Egyptian Thoth, scribe of the gods and keeper of hidden knowledge. Texts attributed to him, written in Greek-speaking Egypt in the early centuries of the common era, shaped Western esoteric thought from the Renaissance alchemists to modern ceremonial magic and Wicca.

The short text known as the *Emerald Tablet* holds its most famous line: *that which is below is like that which is above, and that which is above is like that which is below.* In 1908, a small book called *The Kybalion*, published anonymously by "Three Initiates," set out Hermetic teaching as seven principles. Whatever its exact origins, *The Kybalion* remains one of the clearest maps a remote viewer can carry.

Let us walk through the seven, and see what each one teaches at the coordinate.

1. Mentalism: The All is Mind

> *"The All is Mind; the Universe is Mental."*

The first principle says that reality is, at its root, consciousness. Matter, energy and space are expressions of one universal mind, which the Hermetists call The All.

If that is true, distance is not what it seems. Your mind is not a sealed box locked inside your skull; it is a wave on the surface of one ocean of mind. The cliff in Ireland and the viewer far away are already within the same field. Remote viewing, in this light, is not sending your mind somewhere far away. It is remembering that, at the deepest level, you are already there.

This is the principle behind the code. The code does not carry information. It carries **intention**, and in a mental universe, intention is the thread that connects.

2. Correspondence: As above, so below

> *"As above, so below; as below, so above."*

Patterns repeat across levels of reality: the atom and the solar system, the cell and the city, the inner life and the outer world. What happens on one plane corresponds to what happens on another.

For the viewer, correspondence explains why impressions arrive as *likenesses* rather than photographs. You perceive "curved, enclosing, gathering place" before you could ever say "amphitheater." Your inner experience corresponds to the target's qualities, its shape and feeling, rather than copying its appearance. It also explains why your analytical overlays are so often "right family, wrong member" (Chapter 8): the mind has caught the correspondence and then reached for the wrong name.

3. Vibration: Nothing rests

> *"Nothing rests; everything moves; everything vibrates."*

Everything, from stone to thought, is vibration at some rate. The difference between matter and spirit, the Hermetists say, is a difference in frequency.

This principle sits behind all of Chapter 3: the brainwave states, the binaural tones, the singing bowl. When you slow your breath and lower your inner chatter, you change your own rate of vibration, becoming sensitive to subtler frequencies. The ideogram, too, is vibration: a tremor in the hand that echoes the target's dominant movement, flat, wavy or rising.

4. Polarity: Everything has its opposite

> *"Everything is dual; everything has poles... opposites are identical in nature, but different in degree."*

Hot and cold are not two things but two ends of one scale. So are light and dark, high and low, busy and still.

Stage 2 is a practice of polarity. You are not asked "is it a temple?" but "where on the scale does it sit?" Warm or cool? Bright or dim? Crowded or isolated? Placing an impression on its scale is far more reliable than naming. Polarity also teaches balance in your own practice: between structure and intuition, between belief and honest checking.

5. Rhythm: Tides in everything

> *"Everything flows, out and in; everything has its tides."*

All things move in cycles: seasons, moon phases, breath, moods. Your practice has tides too. There will be weeks when the signal seems to pour through and weeks when nothing comes. The Hermetic answer is not to fight the tide but to keep showing up, knowing it will turn.

This is why Scry records time of day, and why you may find dawn or dusk works best for you. It is also why daily rhythm, a short session every day, is more powerful than a long session every few weeks.

6. Cause and Effect: Nothing by chance

> *"Every cause has its effect; every effect has its cause."*

The Hermetists taught that chance is only a name for causes we have not yet seen. This principle is the spiritual heart of honest feedback. Every session is a cause, and the reveal is its effect. If you bend your results to look better, you break the chain and learn nothing. If you record honestly, every effect teaches you about its cause: which state, which technique, which hour made the difference.

It is also why the 25% chance baseline in Judge Mode matters even to the believer. Comparing yourself with chance is how you discover the real causes at work in your own practice.

7. Gender: Receptive and projective

> *"Gender is in everything; everything has its masculine and feminine principles."*

In Hermetic language, gender means not sex but two complementary forces: the projective, which directs and acts, and the receptive, which receives and nurtures. Every act of creation needs both.

A session needs both too. The projective force sets the intention, holds the code, keeps the structure and declares AOL. The receptive force waits, listens and lets impressions arise without grasping. Too much projection and you invent the target. Too much receptivity and you drift into reverie. The skilled viewer moves between the two like breath.

Gnosis: knowing by experience

The Gnostic traditions that grew alongside Hermeticism drew a line between *pistis*, belief, and *gnosis*, direct knowing. Gnosis is not something you are told. It is something you experience for yourself.

Remote viewing, done honestly, is a path of gnosis. No book can prove to you that the mind reaches beyond the body. But a sealed target, a blank page and an honest reveal can let you discover it, or not, for yourself. When a session lands, when you wrote "cold, wet, darkness, weightless" and the photograph shows the deep sea, that knowing belongs to you. No one can give it to you and no one can take it away.

That is why this book asks you to keep honest records even as you open your heart to the mystery. Belief and evidence are not enemies. In the Hermetic view they are two poles of one path, and the seeker walks between them.

> **In the App:** Use the **reflection notes** on the Reveal screen to record which principle a session taught you. Over time, your logbook becomes a personal Hermetic journal.

> **Practice: the seven-day cycle.** For one week, take one principle per day. Before your session, read its line aloud and hold it as your intention. Afterward, write one sentence about how the principle showed up in the session.

Chapter 12: Other Doors

Controlled Remote Viewing is a disciplined, grounded method. You stay in your chair, eyes soft, hand on the pen, and gather fragments. But it is only one door. The traditions that came long before CRV used others: the spirit journey, the trance, the dream at the edge of sleep. Scry lets you log three of these alongside CRV so you can learn, from your own record, which door opens most easily for you.

Two ways of reaching

It helps to picture remote viewing methods on a single scale.

At one end is **telemetry**: you stay fully in your body and receive data, the way a ground station receives signals from a distant probe. CRV sits here. It is precise and repeatable, but it can feel thin, like reading a weather report of a place.

At the other end is **presence**: your sense of *where you are* shifts, and you seem to stand at the target, feeling its air, hearing its echoes, looking around. Astral projection sits here. It is vivid and immersive, but harder to control and to record.

The hypnagogic state and the quiet float sit between. Many experienced practitioners see these not as rivals but as octaves of one continuum. The skill is learning to move along it deliberately.

Method	Where your awareness is	Strength	Risk	Best for
CRV	Fully in the body	Structure, accuracy, clean records	Thin, fragmentary impressions	Daily training, beginners
Quiet Float	In the body, softly open	Gentle, intuitive, low effort	Drifting, vague results	Tired days, emotional targets
Hypnagogic	At the edge of sleep	Vivid, spontaneous imagery	Falling asleep, dream contamination	Imagery, atmosphere
Astral / OBE	Seemingly at the target	Full sensory presence	Hard to control and verify	Experienced practitioners

The astral door

Astral projection, or the out-of-body experience (OBE), is the sense of leaving the physical body and moving freely as a body of awareness. It is described in Egyptian texts, Tibetan teachings, shamanic practice and the Western mystery schools. In the twentieth century, the American businessman Robert Monroe described his own spontaneous OBEs in *Journeys Out of the Body* (1971) and founded the Monroe Institute to study and teach them, using sound to guide people into what he called "mind awake, body asleep."

In many traditions, astral travel is part of training. Initiates are sent out of their bodies to a place or a person and asked to return with a detail they could not have known. That is remote viewing in its oldest form, and it is a test with an answer key, just like a Scry session.

A basic astral practice

There are many methods. This is a simple, safe sequence to begin with. Give yourself 30 to 45 minutes and choose a time when you are relaxed but not exhausted; early morning after a few hours of sleep works well for many people.

1. **Prepare.** Lie on your back in a quiet, dark room. Do the 4-7-8 breath and a full body scan (Chapter 4). Put on the Theta preset if you like.
2. **Set the intention.** Hold the coordinate clearly: *I will travel to the target for this code, observe it, and return safely to my body.*
3. **Deepen.** Let the body grow heavy and still while the mind stays gently alert. Count slowly down from 100 if thoughts intrude.
4. **Notice the threshold.** Many people feel vibrations, buzzing, a sense of heaviness or floating, or hear rushing sounds. These are normal signs of the threshold. Stay calm and curious.
5. **Separate.** Imagine gently rolling sideways out of the body, rising like a balloon, or pulling yourself up a rope hand over hand. Do not force it. If nothing happens, keep resting in the threshold; that state alone is valuable for viewing.
6. **Travel by intention.** Rather than flying "through" space, think of the target code and *expect to be there*. Many travellers describe darkness, a sense of motion, then arrival.
7. **Observe like a viewer.** Once there, use Stage 2 discipline. What is the temperature? The textures? The light? What do you hear? Resist naming. Gather sensations.
8. **Return.** Hold the intention to return, feel the weight of your physical body, wiggle fingers and toes, and open your eyes.
9. **Record immediately.** Astral memories fade like dreams. Write your impressions before you do anything else, then enter them in Scry.

Do not be discouraged if your first attempts give you only the threshold, or only darkness. Darkness can itself be data: weightless, dark and silent may be exactly what the target is like. (You will hear a story about that in the author's introduction.)

Fear and safety in astral work

Newcomers sometimes fear they will not get back. Practitioners across traditions agree on the reassurance: your awareness returns to the body naturally, often at the first flicker of fear. The more common experience is sudden return before you wanted it.

You may also encounter **sleep paralysis**, a brief state on waking or falling asleep in which the body cannot move while the mind is alert, sometimes with vivid or frightening imagery. It is a known, harmless sleep phenomenon and often accompanies OBE practice. Breathe slowly, focus on moving a single finger, and it will pass.

Use your tradition's protections if you have them: casting a circle, calling on guides, visualizing white or blue light around you. And always ground afterward: water, feet on the floor, something to eat.

The hypnagogic door

The hypnagogic state is the twilight between waking and sleep. Images arise unbidden: faces, landscapes, flashes of colour, fragments of speech. They are often startlingly vivid and arrive without the effort of imagination.

Artists and inventors have long tried to harvest this state. Salvador Dalí is said to have dozed in a chair holding a key over a plate, so that when he fell asleep the clatter would wake him with the images still fresh. Recent sleep research has explored the same trick and found that this brief, early stage of sleep seems to help people find creative solutions.

You can use it for viewing:

1. Sit in a reclining chair, not a bed, so you are less likely to fall fully asleep.
2. Hold a light object, such as a spoon, a pen or a set of keys, loosely in your hand over the floor.
3. Hold the coordinate in mind and let yourself drift.
4. When the object drops and wakes you, write or speak the images you were seeing at once.
5. Repeat two or three times, then record everything in Scry.

The great risk is dream contamination: hypnagogic imagery mixes target impressions with ordinary dream material. Treat named images as AOL, as always, and draw out the sensations.

The quiet float

The quiet float is the gentlest door. Sit comfortably, breathe, and simply rest in awareness with the coordinate softly in mind. You do not move through stages or force impressions. When something arises, note it; when nothing does, keep floating.

It suits days when CRV feels like hard work, or when you are emotionally full. It also suits viewers whose gift is atmosphere and feeling more than shape. Some people find it is their most accurate method of all. Your stats will tell you.

Logging other methods honestly

Whatever door you use, the reveal works the same. Choose the technique in the Session Method bar, enter your impressions in the same text box, choose descriptors from what you actually perceived, and judge and rate yourself as strictly as ever.

Over dozens of sessions, the method breakdown on the Stats screen will show your average match score for each technique. You may be surprised. Some people who love astral work find their CRV is more accurate; some careful CRV viewers discover their best hits come in the hypnagogic twilight. Let the evidence guide you to your own best door.

> **In the App:** In the **Session Method** bar, choose *Astral Projection / OBE*, *Hypnagogic State* or *Meditation / Quiet Float*. The Guides library includes *The Bridge Between Coordinate Viewing and Astral Projection*.

> **Practice: the three-door month.** Over four weeks, run CRV as your main method but devote one session a week to each of the other doors. At the month's end, compare your method breakdown and write down which door felt most natural and which was most accurate. They may not be the same.

Chapter 13: Levels of the Same Truth

Remote viewing does not stand alone. It belongs to a family of experiences in which people report that consciousness reaches beyond the body: the near-death experience, the out-of-body experience, and the lucid dream. Seen side by side, they look like rungs on a single ladder, each one showing us, in its own way, that we are more than our skin.

The ladder of experience

Experience	How it happens	How common	What it suggests to the seeker
Lucid dream	Becoming aware that you are dreaming, within the dream	Most people have had at least one	Awareness can wake up inside the mind's own worlds
Hypnagogic imagery	Visions at the edge of sleep	Very common	The image-making mind works without the ego's effort
Remote viewing	Describing a hidden target while awake	Learned through practice	Perception may reach where the senses cannot
Out-of-body experience	Seeming to leave the body and see from outside it	Reported by a sizeable minority of people at least once	Awareness may not be fixed to the body's location
Near-death experience	Vivid experiences during cardiac arrest or near death	Reported by a minority of cardiac arrest survivors	Consciousness may continue when the body fails

Each rung asks a little more of the traveller, and each is surrounded by more debate. Let us take them in turn.

The near-death experience

In 1975 the psychiatrist Raymond Moody published *Life After Life*, collecting accounts from people who had come close to death and returned. He coined the term **near-death experience** (NDE). The accounts shared striking features across cultures and beliefs: a sense of peace, leaving the body and seeing it from above, moving through darkness or a tunnel toward light, meeting deceased loved ones or beings of light, reviewing one's life, and a reluctant return.

In 2001 the Dutch cardiologist Pim van Lommel and colleagues published a study in *The Lancet* that followed 344 cardiac arrest survivors. Sixty-two of them, about 18%, reported an NDE, and many described lasting changes afterward: less fear of death, more compassion, a sense of purpose.

The great question is whether NDEs show consciousness surviving apart from the brain, or whether they are the brain's own dramatic response to crisis. Researchers have tried to test this by placing hidden images on high shelves in hospital rooms, visible only from above, and asking survivors who report leaving their bodies what they saw. So far, such tests have produced no confirmed hit, partly because very few out-of-body reports came from the rooms with shelves. A few individual cases, where patients described events in the room during their arrest, remain intriguing and much discussed.

For the remote viewer, NDE accounts matter for a simple reason. They are the most dramatic reports we have of perception from a location outside the body. And they raise the same question every Scry session asks: *can what was perceived be checked?*

The out-of-body experience

You met the OBE as a deliberate practice in Chapter 12. Many people have one spontaneously, without any training: during illness, deep relaxation, meditation, exhaustion or the edge of sleep. They report seeing their own body from outside, floating near the ceiling, or moving through familiar places.

Neuroscientists have found that stimulating certain regions of the brain can create a feeling of being outside the body, which some take as evidence that OBEs are produced by the brain. Practitioners answer that a doorway in the brain does not tell us where the doorway leads. Both views can be held with respect while you test your own experiences against verifiable targets.

The initiatory tradition offers a beautiful test that does exactly this. The teacher places objects on an altar. The student, in trance, travels out of the body and returns to describe them. It is a ritual version of the Scry session: a hidden target, a journey, a report, and a reveal.

The lucid dream

A lucid dream is a dream in which you know you are dreaming. Suddenly the dream world sharpens. You realize, *this is a dream*, and you can often choose what to do next.

Lucid dreaming is the best-established of these experiences scientifically. In the late 1970s and early 1980s, researchers including Keith Hearne in England and Stephen LaBerge at Stanford proved it real in the sleep laboratory. Sleepers agreed to signal with a set pattern of eye movements when they became lucid, and the signals appeared on their recordings during verified REM sleep. Awareness, it turned out, really can wake up inside a dream.

For the seeker, the lucid dream is the first rung of the ladder: proof, available to almost anyone with practice, that awareness is not the same as the ordinary waking mind.

Training lucidity

Three simple methods have good support from dream research.

1. **Reality checks.** Several times a day, ask yourself, *Am I dreaming?* and test it: look at text, look away and look back; in dreams, text often changes. Or try to push a finger through your palm. The habit carries into dreams.
2. **Wake back to bed.** Set an alarm for about five hours after you fall asleep. Stay awake for 20 to 30 minutes, reading about lucid dreams or reviewing your dream journal, then return to sleep.
3. **Mnemonic induction (MILD).** As you fall back asleep, repeat: *Next time I'm dreaming, I will remember that I'm dreaming*, while picturing yourself becoming lucid in a recent dream.

Keep the Dream Journal beside you (Chapter 14). Remembering dreams is the foundation of lucidity.

Viewing from within a dream

Once you can become lucid, you can try a remarkable experiment. Before sleep, open the Daily Target and note today's code, but do not view yet. (The daily code changes once a day, so view it the same day you dream it.) Hold the code as your intention. When you become lucid, call it out in the dream: *Show me the target for K7Q-294.* Many dreamers find the scene shifts. Observe it as a viewer: textures, temperature, light, sound.

On waking, record the experience immediately in your notes, then enter it into the session, choose your descriptors, and submit. Log the technique as Hypnagogic State or Meditation, and note "lucid dream" in your impressions so you can track these sessions separately. Then link the dream in your Dream Journal (Chapter 14).

One ladder, many rungs

Why put all of these in one chapter? Because seen together they tell a single story, the story many teachers, including the author of this book, hold at the heart of their path: that consciousness is larger than the body; that the body is a vehicle and not the whole of who we are; and that awareness can travel, dream, perceive and perhaps continue in ways our ordinary waking minds forget.

You do not need to accept this story to practise remote viewing. But if you hold it, as many readers will, let it make you more careful, not less. The more precious a belief, the more it deserves honest testing. Every hit you earn under blind conditions, every dream you record before its feedback, becomes a small, personal piece of evidence on the ladder, gnosis that is truly your own.

> **In the App:** The **Dream Journal** lets you record dreams with a lucidity level from low to fully lucid, and link them to sessions. The Guides library includes *The Bridge Between Coordinate Viewing and Astral Projection*.

> **Practice: climb one rung.** Choose the rung just above where you are now. If you have never had a lucid dream, practise reality checks for two weeks. If you dream lucidly already, try the dream-viewing experiment above once a week for a month.

Chapter 14: Dreams and the Feedback Ripple

Every night you enter a state in which images arise on their own, time bends, and the ordinary rules loosen. For the remote viewer, that makes sleep a laboratory. This chapter shows you how to keep a dream journal that works alongside your viewing, and how to look for one of the strangest effects in the field: dreams that seem to preview what you will see tomorrow.

Dreams in the history of psychic research

In 1927 the British engineer J. W. Dunne published *An Experiment with Time*. He described dreams that seemed to show events he would encounter days later, often in a newspaper or a book. Rather than simply believe it, Dunne invented a method: write down every dream immediately on waking, then watch for later matches. He urged his readers to try it themselves.

In the 1960s and 1970s, psychiatrist Montague Ullman and psychologist Stanley Krippner ran dream telepathy experiments at Maimonides Medical Center in New York. A sleeping volunteer was woken during dream periods and asked to describe the dream, while a "sender" in another room concentrated on a randomly chosen art print. Independent judges then compared the dream reports against several possible prints. Some results were striking; later attempts to repeat them were mixed.

Dunne's method and the Maimonides design share the two features that matter: **record before you know**, and **compare honestly afterward**. Scry's Dream Journal is built on exactly those two rules.

Time displacement

Remote viewing researchers noticed something odd. Sometimes a viewer's description fitted not the target, but the *feedback*: the photograph they would see at the end, or even a different image they saw later that day. They called it **displacement**.

One explanation, popular among practitioners, is that the strongest moment of a session is the emotional shock of the reveal. If perception is not bound by time, that future moment may send ripples backward, and those ripples can surface wherever the mind is most open: in hypnagogic imagery, in daydreams, and above all in dreams.

Whether or not this is true, it is testable. If you record dreams faithfully and then compare them with targets revealed later, you can see for yourself whether matches occur more than you would expect.

Keeping a dream journal that works

The single most important rule: **write it down before you do anything else.** Dreams fade within minutes of waking. Don't check your phone, don't get up, don't talk. Keep the app or a notebook within reach of your bed.

Scry's Dream Journal asks for a few things for each dream.

Field	What to write	Tip
Title	A short name for the dream	Use the most vivid image: "The red tower in fog"
Description	What happened, as fully as you can recall	Include sensations, not just events
Symbols	Key images, objects, colours or places	One word each: *water, stairs, gold, crowd*
Lucidity	Low, medium, high, or lucid	How aware you were that you were dreaming
Mood	The emotional tone	*Calm, uneasy, joyful, awed*

Field	What to write	Tip
Linked session	A session the dream seems connected to	Link only after the reveal

Even fragments are worth recording. "Something about a cold blue light, and the sound of wind" is a valid entry, and fragments are often the most useful kind for viewing.

Linking dreams to sessions

Here is the practice that brings the journal and the viewing together.

1. Record your dreams every morning, before you view.
2. Later that day, run your session as usual: the dream has not been told the target, and neither have you.
3. After the reveal, look back at the morning's dreams. Do any symbols, sensations or scenes correspond to the target?
4. If you find a genuine correspondence, open the dream entry and **link it** to the session. Scry awards the **Oneiric Precognition** badge for your first link.

Because the dream was recorded before the target was revealed, the timestamp is your proof. That is what separates a real dream-to-target match from the memory's habit of rewriting dreams after the fact.

Judging dream matches fairly

Dreams are rich, and with enough images in a journal, something will always seem to match something. To keep yourself honest:

- **Look for specifics.** "I dreamt of water" matching an ocean target is weak; water is common in dreams. "I dreamt of standing inside a huge stone ring, rows of seats rising, the sun beating down" matching an amphitheater is strong.
- **Count the misses as well.** Keep a tally of the days you checked and found nothing. Twenty checks with one clear match tells a different story from twenty checks with eight.
- **Rate dream links like sessions.** Would a strict, kind teacher agree this is a real correspondence?
- **Compare with other days.** Sometimes ask: does this dream fit *yesterday's* target, or a random one, just as well? If so, the match may be coincidence.

Dream symbols and the viewer's language

Dreams speak in symbol and metaphor. A target that is a vast, silent desert might appear in a dream as an empty white room; a bustling city as a crowded party. Over time you will learn your own dream language, just as you learn your own ideograms.

Keep a page in your notebook titled **My Dream Symbols**. Each time a dream links to a target, note the dream image and the target feature it seemed to stand for. After a few months you will have a personal dictionary, and dreams that once seemed random will begin to read like messages.

Dreams as part of the path

In many traditions dreams are not idle; they are a second classroom. Students are taught to bring questions to sleep and to listen for answers. Some ask their dreams for guidance from teachers or guides. Others practise dream incubation, holding one question or symbol in mind as they fall asleep.

You can incubate a target the same way. Hold the day's Daily Target code in mind as you fall asleep, record any dreams on waking, then view and reveal. Note the technique as Hypnagogic State and write "incubated" in your impressions. Compare these sessions with your ordinary ones over a month.

The Dreamer's Ladder

The Dream Journal is more than a record. It is the first rung of a ladder that many traditions teach, and each rung prepares you for the next.

Rung	What happens	How you train it	Sign you are ready to climb
1. Remember	You recall your dreams on waking	Record every morning, even fragments	Most mornings you recall at least one dream
2. Realize	You become aware that you are dreaming, inside the dream	Reality checks, wake back to bed, MILD (Chapter 13)	Your journal shows dreams marked high or lucid

Rung	What happens	How you train it	Sign you are ready to climb
3. Shape	Within a lucid dream, you choose what happens: you fly, change the scene, call up a target	Set an intention before sleep; when lucid, act on it calmly	You can hold lucidity long enough to act
4. Create	You carry the lesson into waking life	Live the first Hermetic principle on purpose	You meet each day as its conscious creator

The first three rungs are about the dream. The fourth is about everything else.

In a lucid dream, you discover something astonishing: the world around you is made of mind, and when you become aware, you can shape it. The Hermetic teachers say waking life is not so different. *The All is Mind; the Universe is Mental.* Most people live inside the world they perceive without ever realizing that their perception, their attention, their beliefs and their choices are part of what makes it. The dreamer who has learned to wake up inside the dream begins to wake up inside the day as well.

That is the fourth rung. You notice the stories you tell yourself, and you choose better ones. You notice where your attention goes, and you direct it. You stop living as a passenger in your world and start living as its author.

Training each rung:

1. **Remember.** For 21 days, record a dream every morning before you move. Write fragments if that is all you have.
2. **Realize.** Do ten reality checks a day. Each time, ask sincerely, *Am I dreaming?* and look closely at your surroundings.
3. **Shape.** Before sleep, choose one simple act for your next lucid dream: look at your hands, fly, or call out the Daily Target code. When lucidity comes, stay calm and do it.
4. **Create.** Each morning, after recording your dream, write one sentence of intention for the day, as a lucid dreamer would: *Today I choose to notice… Today I choose to meet… Today I create…* Each night, note how the day answered.

> **In the App:** Open **Dreams** to record entries with title, description, symbols, lucidity and mood, and to link a dream to any past session. The Guides library includes *Precognitive Vectors: Linking the Dream Journal to Target Feedback*.

> **Practice: the 21-day dream experiment.** Record your dreams every morning for 21 days, before viewing. After each reveal, check that morning's dream. At the end, count your strong matches, weak matches and blanks. Be as strict as you would want a sceptic to be.

Chapter 15: Viewing Together

Remote viewing is often practised alone, but it has always had a communal side. The SRI researchers worked in teams. The military unit trained together. Covens, lodges and meditation circles have long gathered to journey, scry and dream as one. Viewing with others brings encouragement, accountability and some of the most memorable sessions you will ever have. It also brings one special danger, which this chapter will help you avoid.

Why view in a group

- **Encouragement.** Remote viewing can be met with disbelief by friends and family. A group of fellow practitioners is a place where your experiences are welcome.
- **Accountability.** Meeting regularly keeps you practising, and sharing results keeps you honest.
- **Comparison.** When several people view the same target, you see how differently minds perceive. One person catches the colour, another the sound, another the feeling. Together they often describe more than any one alone.
- **Learning.** Experienced members can guide newcomers through ideograms, AOL and honest rating.
- **Shared wonder.** There is nothing quite like the moment a whole circle sees the reveal together and realizes three people independently wrote "spiral" for a target with a winding stair.

The danger: peer overlay

The special danger of group work is that impressions are contagious. The moment one person says "I'm getting water," everyone else's mind starts seeing water. This is **peer AOL** (Chapter 8), and it can turn a circle of independent viewers into a single echo.

The cure is one firm rule:

> **No one shares a single impression until everyone has finished and submitted.**

No talking, no gestures, no sighs of recognition, no peeking at a neighbour's page. Silence is the circle's protection.

Running a Viewing Circle in Scry

Scry's **Circles** feature lets a group view one shared, hidden target together. One person acts as the **host**, and the circle's record lives on the host's device.

1. **The host creates a circle.** Scry generates a fresh coordinate and secretly picks a target. Nobody, including the host, sees it.
2. **The host shares the code.** Read it aloud, or send it to the group if you are meeting remotely.
3. **Everyone views independently.** Each person runs their own preparation ritual and records their ideogram, impressions and descriptors on paper or in their own notes. Keep the room silent, or keep video calls muted.
4. **The host enters each submission.** One by one, each viewer gives the host their name, their impressions and their chosen descriptors, which the host adds to the circle. Sketches can be added too.
5. **Only when every submission is in, the host unveils the target.** Scry shows the target and highlights which of each person's descriptors matched.
6. **Discuss.** Now, and only now, the circle talks.

Because the host enters everyone's submissions before the reveal, the host should be especially careful to keep a neutral face and voice while others report. Many circles rotate the host role each week.

Discussing the reveal

The discussion is where much of the learning happens. A good format:

1. **Silent look.** Everyone looks at the target for a full minute without speaking.
2. **Round of hits.** Each person names one impression that matched.
3. **Round of surprises.** Each person names one thing they dismissed or missed that turned out to be there.
4. **Round of AOLs.** Each person shares an overlay and what real quality it carried.
5. **Patterns.** What did several people perceive independently? What did no one get?

Celebrate the hits, but give equal warmth to honest misses. A circle where people feel safe reporting misses is a circle whose hits mean something.

The Daily Target: a worldwide circle

The Daily Target (Chapter 5) is, in a sense, a circle of everyone. All Scry users receive the same code on the same day, and the target is the same for all. Completing it earns the **Synchronized Mind** badge.

You can use this to run a loose circle with friends anywhere in the world. Agree that everyone will view the day's code by evening, without discussing it. Then meet, in person or online, to compare notes after everyone has revealed. Because each person views in their own app, the records stay independent.

Building a supportive community

Whether your circle is three friends or thirty strangers online, a few principles help it thrive.

- **Make it safe.** Members should be able to share experiences, including strange or emotional ones, without mockery. What is shared in the circle stays in the circle unless the person says otherwise.
- **Welcome every level.** Pair newcomers with experienced members. Everyone was a beginner once.
- **Keep it honest.** Encourage strict self-rating. A culture of inflated hits feels good for a month and then hollows out.
- **Keep it regular.** A fixed weekly time builds momentum: the same night, the same hour.
- **Respect beliefs.** Members will hold different views about what remote viewing is. Spiritual and sceptical practitioners can learn a great deal from each other if both are respected.
- **Give back.** As you grow, mentor others, share resources and host sessions. A community stays alive through the people who serve it.

A circle as a sacred space

In many traditions, a circle is cast before working: a boundary that holds energy in and keeps distraction out. You might open a viewing circle the same way: a moment of silence, a shared breath, a candle lit, the singing bowl struck once. At the end, close it just as deliberately, with thanks. The ritual is simple, but it tells everyone present: *what happens here matters.*

> **In the App:** Open **Circles** to create a group session, share its code, enter each viewer's submission, and unveil the shared target. **Daily** gives every user worldwide the same coordinate each day.

> **Practice:** Gather at least two other people for a circle this month. Run one session using the full silent protocol above. Afterward, write down which impression the group as a whole got right that no single person had alone.

Chapter 17: The Inner Work

Most of this book is about perceiving a target outside yourself. This chapter turns the lens around. Remote viewing, practised steadily, changes the viewer: how you listen to intuition, how you meet fear and doubt, how you understand your place in the larger whole. For many practitioners, this inner change becomes the real reward.

Intuition, trained

Everyone has intuition: the hunch about a stranger, the sense that something is wrong before you know why, the answer that pops up in the shower. Most of us never train it, so we cannot tell a true hunch from a passing fear or a wish.

Remote viewing is one of the few practices that trains intuition *with feedback*. Every session, you notice faint impressions, write them down, and then learn which ones were right. Over months you begin to recognize how true impressions feel for you: perhaps quieter, cooler, more matter-of-fact than imagination. Many viewers say that this recognition starts showing up in daily life. They notice their first impressions of people and places more clearly, and they learn when to trust them.

A few ways to carry the training beyond the app:

- **Daily first impressions.** Before opening an email, answering a call or entering a meeting, note one word for your first impression. Check it later.
- **The intuition log.** Keep a page in your notebook for everyday hunches, with the date and the outcome. Treat it with the same honesty as your Scry record.
- **Notice the body.** True intuitions often arrive with a physical signal: a settled stomach, a lifted chest, a tightness in the throat. Learn your own signals.

One caution belongs here. Intuition is a voice worth hearing, not a judge to obey alone. For important decisions about health, money, law or relationships, let intuition raise questions and then gather facts and good advice before you act.

Meeting the barriers

Every practitioner meets inner barriers. Naming them is the first step to moving through them.

Barrier	How it shows up	What helps
Doubt	"I'm just making this up. I'm not psychic."	Keep practising and let the record speak; doubt shrinks with each honest hit
Fear of being wrong	Freezing, writing nothing, avoiding the reveal	Remember that misses are data; set a goal of honest records, not hits
Perfectionism	Discouragement after every miss	Track trends over 20 sessions, not single results
Fear of others' judgment	Hiding the practice, practising rarely	Find a circle (Chapter 15) where the work is welcome
Ego and pride	Inflated self-ratings, needing to be special	Compare self-ratings with Judge Mode; practise humility (Chapter 8)
Fear of the unknown	Anxiety about what you might encounter	Ground, protect and close each session; go at your own pace

Notice that every remedy in the right-hand column comes back to the same two things: **steady practice** and **honest records**. The protocol is not only a method for viewing targets; it is a method for outgrowing your own fears.

Practice as a mirror

Each session reflects the viewer back. You may notice that your AOLs keep returning to certain images: places from childhood, things you long for, things you fear. You may notice that you see water every time you feel sad, or crowds every time you feel lonely. These patterns are not only errors to be corrected. They are messages about your inner life.

Keep a section of your notebook for these reflections. When a session stirs a memory or a feeling, write it down and ask gently what it might be telling you. Some practitioners find this leads to real self-understanding and healing.

If what surfaces is painful or overwhelming, especially old trauma, please do not try to work it out through viewing alone. Remote viewing and meditation can sit beautifully alongside counselling or therapy, but they are not a substitute. Reaching out for support is itself a strong spiritual act.

Growing on the spiritual path

For many readers, remote viewing is one part of a larger spiritual life. It can strengthen that life in specific ways.

- **Stillness.** The preparation ritual is a daily meditation. Practised for months, it deepens every other spiritual practice you hold.
- **Discernment.** Learning to tell perception from overlay is the same skill that lets a seeker tell true guidance from wishful thinking, in divination, in prayer, or in messages from guides.
- **Humility.** A sealed target is a wonderful teacher of humility. It will not let you pretend.
- **Connection.** Every accurate impression is a small experience of the Hermetic truth that all is one mind. Many viewers describe a growing sense of kinship with the places they view and the people who live there.
- **Wonder.** Even after hundreds of sessions, the moment of the reveal never quite loses its magic.

Guides, beings and higher contact

Some practitioners, especially in astral and meditative work, report encountering guides, teachers, ancestors or beings of light. Traditions hold these encounters in different ways, as real presences, as aspects of the higher self, or as both. Whatever you believe, bring the same care to them that you bring to your sessions: record what was said or shown, notice how it felt, and let time and results show you whether the guidance was sound. Trustworthy guidance tends to make you kinder, steadier and more honest. Guidance that flatters, frightens or isolates you deserves a second look and a conversation with a trusted teacher.

Carrying it into daily life

The deepest sign of progress is not a higher score. It is a life that feels more awake. You notice the texture of the morning air. You sense the mood of a room. You hold your own assumptions more lightly. You meet the unknown with curiosity rather than fear.

That is inner vision becoming outer knowledge, and outer knowledge feeding inner vision, the circle this book is named for.

> **In the App:** Use the **reflection notes** on each Reveal to record what a session taught you about yourself, not just about the target.

> **Practice: the barrier letter.** Write a short letter to the barrier that troubles you most: doubt, fear, perfectionism or pride. Tell it what you have learned from your record so far. Re-read the letter after your next ten sessions.

Chapter 18: Ethics

Any power worth having is worth using well. Whatever you believe remote viewing is, the intention to perceive what is hidden carries responsibility, toward other people, toward the truth, and toward yourself. This chapter sets out a simple code for practice.

Harm none

Many pagan practitioners will know the Wiccan Rede: *an it harm none, do what ye will.* It is as good a foundation for remote viewing as any. Before a session, and especially before choosing your own targets, ask: *could this harm anyone, including me?* If the honest answer is yes, or even maybe, don't do it.

The early government programs show what happens when this question is never asked. Their viewers were tasked against people and places for purposes of surveillance and war, often with little regard for the viewers' own wellbeing. Modern practice can choose a better way: learning, growth, healing and wonder.

Places, not people

Scry's targets are places: landmarks, wild sites and coordinates. That is deliberate, and it is a good rule for your own practice too.

- **Do not target private individuals without their clear, informed consent.** Trying to perceive where someone is, what they are doing, or what is in their home is an intrusion, whether or not you believe it works.
- **With consent, set boundaries.** If a friend volunteers as a target, for instance by visiting a secret location while you view, agree beforehand what is in bounds and what is not, and stick to it.
- **Never use viewing to pursue, monitor or confront anyone.** Not a former partner, not a rival, not a suspect.

Missing people and crimes

Viewers are sometimes drawn to missing-person cases or unsolved crimes. The impulse is compassionate, but the risks are serious. Families in crisis can be given false hope or false fears; innocent people can be suspected; investigators can be distracted.

If you feel called to help, work only through proper channels, never contact a family uninvited, never publish impressions about a real case, and never present a session as fact. The kindest thing you can usually do is support the people searching and leave the investigation to the authorities.

Health and the body

Some practitioners view for health information about themselves or others. Remote viewing is not a diagnostic tool. Never tell someone they have, or do not have, an illness based on a session, and never use viewing in place of medical care. If you sense something about someone's health, the ethical response is to encourage them to see a professional, not to give a verdict.

Honesty about results

The remote viewing world has been harmed by exaggerated claims. You can help repair that.

- **Report your record fairly.** If you share your results, share your hit rate and your misses, not just your best session.
- **Don't overclaim.** Say "my Judge Mode hit rate over 60 sessions is 38%," not "I can see anywhere on earth."
- **Be careful with money.** If you ever teach or offer readings for a fee, be clear about what you offer and what you cannot promise. Never make someone's health, safety or major life decisions depend on a session.

- **Respect sceptics.** A sceptic who asks good questions is doing you a favour. Answer with your records, not with anger.

Care for the viewer

Ethics includes how you treat yourself.

- **Know your limits.** If sessions leave you anxious, disoriented or unable to sleep, slow down or pause.
- **Ground every session.** Close what you open (Chapter 4).
- **Keep balance.** Remote viewing should enrich your life, not replace it. Friends, work, rest and body need tending too.
- **Protect young people.** Explorations of trance, astral travel and altered states should be guided carefully for minors, with a trusted adult involved.
- **Seek support.** If practice brings up distressing experiences, talk to a teacher, a friend, or a mental health professional.

Respect in community

In circles and online groups, treat other viewers' sessions as their own. Do not share someone's impressions, sketches, dreams or personal reflections without permission. Do not mock a miss or a belief. Hold the circle as a safe place.

The threefold return

Many Wiccans also hold the Law of Return: that what we send out comes back to us, some say threefold. In the language of this book, the Hermetic principle of cause and effect says the same thing. Practice carried out with honesty, consent and care returns as clarity, trust and growth. Practice carried out carelessly returns as confusion, broken trust and self-deception.

Choose the first path. It is also the path on which your sessions will mean the most.

A viewer's code

1. I will harm none, including myself.
2. I will view places freely and people only with consent.
3. I will keep my sessions blind and my records honest.
4. I will not present impressions as facts.
5. I will never use viewing to replace medical, legal or emergency help.

6. I will respect the privacy and beliefs of others.
7. I will ground what I open and close what I begin.

Copy it into the front of your notebook.

> **In the App:** Scry's targets are all public places and natural sites, chosen to keep your practice ethical by default.

> **Practice:** Read the viewer's code aloud before your next seven sessions. On the seventh day, write down which line you find hardest to keep, and why.

Part V: Training

You now have the whole method. Part V puts it into a schedule you can follow, and then looks ahead to the long road beyond your first month.

Chapter 19: The 30-Day Scry Program

This program takes you from your first coordinate to your first full monthly review in thirty days. Each day takes 20 to 40 minutes. Tick each day off as you go. If you miss a day, don't start over; simply pick up where you left off.

The program follows a simple arc:

Week	Theme	Main tier	Chapters to read
1	Foundations: preparing and catching the ideogram	T1	1 to 6
2	The senses and overlay	T1	7 and 8
3	Feedback, new doors and dreams	T1 and T2	9 to 14
4	Going deeper: vectors, circles and review	T2 and T3	15 to 18

Throughout, log every session honestly, use Judge Mode every time, and rate every session.

Week 1: Foundations

- [ ] **Day 1.** Read Chapters 1 and 2. Write your "why" paragraph (Chapter 1 practice). Explore the app without viewing.
- [ ] **Day 2.** Read Chapters 3 and 4. Run the preparation ritual only: Alpha preset, box breathing, body scan.
- [ ] **Day 3.** Preparation ritual again. Notice how much faster you settle.
- [ ] **Day 4.** Read Chapters 5 and 6. Your first full T1 session with CRV. Focus only on a fast ideogram and a few plain impressions. *First Light* unlocks.
- [ ] **Day 5.** T1 session. Start your **My Ideograms** page after the reveal.
- [ ] **Day 6.** T1 session. Try two ideograms in a row and compare them. *Harmonic Cadence* unlocks if you have viewed three days in a row.
- [ ] **Day 7.** T1 session plus the ideogram drill with a friend's envelopes (Chapter 6).

Week 2: The senses and overlay

- [ ] **Day 8.** Read Chapter 7. T1 session focused on temperature only. *Signal Attunement* unlocks at five sessions.
- [ ] **Day 9.** T1 session focused on sound.
- [ ] **Day 10.** T1 session focused on texture and materials.
- [ ] **Day 11.** Read Chapter 8. T1 session: declare every AOL with "AOL:" and box it.
- [ ] **Day 12.** T1 session. For each AOL, write the qualities it carried.
- [ ] **Day 13.** T1 session at a different time of day than usual. Log it. Deca-Perceiver unlocks at ten sessions.
- [ ] **Day 14.** Day off from viewing. Do the AOL harvest from your sessions so far (Chapter 8 practice).

Week 3: Feedback, new doors and dreams

- [ ] **Day 15.** Read Chapters 9 and 10. T1 session. Write your reflection before you look at the match score. Start recording dreams every morning from today.
- [ ] **Day 16.** Your first T2 session. Expect it to feel harder. Stay with plain sensations.
- [ ] **Day 17.** Read Chapter 11. T1 or T2 session holding the principle of Mentalism as your intention.
- [ ] **Day 18.** Read Chapter 12. Try the quiet float method on a T2 target.
- [ ] **Day 19.** Try the hypnagogic method with a spoon or keys.

- [ ] **Day 20.** Read Chapters 13 and 14. Complete the Daily Target. Check this morning's dream against it after the reveal. *Synchronized Mind* unlocks.
- [ ] **Day 21.** CRV T2 session. Count your Judge Mode hits so far against the 25% baseline.

Week 4: Going deeper

- [ ] **Day 22.** Your first T3 vector session. Aim for a short, plain, true description.
- [ ] **Day 23.** T2 session using your best technique so far.
- [ ] **Day 24.** Read Chapter 15. Run a Viewing Circle with at least two others, or a Daily Target circle with friends at a distance.
- [ ] **Day 25.** T3 session. *Dimensional Cartographer* unlocks once you have viewed all three tiers.
- [ ] **Day 26.** Optional astral practice (Chapter 12), logged as Astral Projection / OBE.
- [ ] **Day 27.** Read Chapters 17 and 18. Copy the viewer's code into your notebook. T2 session.
- [ ] **Day 28.** Daily Target session. Link any matching dream from the past two weeks. *Oneiric Precognition* unlocks with your first link.
- [ ] **Day 29.** Your choice of tier and technique, using everything you have learned.
- [ ] **Day 30.** The monthly review (Chapter 10). Then re-read the paragraph you wrote on Day 1. Write a new one: *What have I learned, and what will I explore next?*

After Day 30

By the end of the month you will have about 25 sessions, a growing ideogram dictionary, a dream journal, and your first real data. That is not enough to prove anything, but it is enough to start seeing your patterns.

For month two, choose one question to explore, such as *does Theta work better for me than Alpha?* or *am I stronger at dawn or dusk?* Change one thing, keep everything else the same, and compare at the end. Keep going until you reach 50 sessions and the **Century Horizon** badge. By then your Judge Mode hit rate will start to tell a meaningful story (Chapter 10), and you will have earned it honestly.

> **In the App:** Track your progress on the **Stats** screen, where every achievement and streak is shown. A full list of badges is in Appendix C.

Chapter 20: Continuing the Journey

Thirty days is a beginning. Those who go furthest in this practice are rarely the most naturally gifted. They are the ones who keep showing up, keep honest records, and keep their sense of wonder. This last chapter gathers what seasoned viewers have learned, looks at where the practice is heading, and sends you on your way.

Five lessons from seasoned viewers

Across decades of practice, from the SRI laboratory to modern circles, the same lessons come up again and again.

1. **Structure frees you.** It seems backwards, but a fixed protocol makes intuition flow more easily, not less. When you don't have to decide what to do next, your attention can rest on the target.
2. **Intention aims you.** A clear, simple intention before each session, *I will describe the target for this code*, sharpens focus more than any technique.
3. **Reflection grows you.** Viewers who study every reveal, especially their misses, improve. Those who glance and move on stay where they are.
4. **Community sustains you.** A circle, a partner, or even one friend who shares the practice will carry you through the weeks when the signal is faint.
5. **Patience rewards you.** Progress comes in waves, with plateaus between. Mastery is measured in hundreds of sessions, not dozens.

Where the practice is going

Remote viewing has travelled a long way: from the oracle's bowl of water to the physicist's laboratory to a training app in your pocket. The next stretch of the road is already visible.

- **More people, more data.** Apps like Scry let thousands of practitioners keep careful, blind records. Shared targets like the Daily Target open the door to comparing many viewers on the same coordinate.
- **Technology as a training partner.** Tools for brainwave feedback, guided sound and even artificial intelligence are entering the field, as training aids, as judges, and, in at least one experiment described in this book (Chapter 16), as subjects.
- **Science and spirit in conversation.** Consciousness research is one of the most open frontiers in science. The questions that remote viewers, astral travellers and lucid dreamers have asked for centuries are increasingly being asked in laboratories too. Practitioners who keep honest records can be part of that conversation.

- **Integration.** More and more people are weaving remote viewing into wider spiritual practice, alongside meditation, energy work, divination, dreamwork and ritual, as this book has encouraged you to do.

Whatever the future brings, the core of the practice will not change: a hidden target, an open mind, and an honest reveal.

A last word of encouragement

There will be days when you wonder whether any of this is real. There will be days when a session lands so precisely that you can hardly breathe. Hold both kinds of days with the same steadiness. The doubt keeps you honest; the wonder keeps you going.

Remember what you are really training. Not just a skill for describing distant places, but a way of being: quieter, more observant, more humble before the unknown, and more open to the possibility that the mind is larger than we were taught.

Inner vision, outer knowledge. Keep walking between them. Your next coordinate is waiting.

> **In the App:** Keep returning to the **Guides** library, where new teachings from Malychite are added over time, and to your **Stats**, where your own story is being written one session at a time.

Appendix A: Descriptor Quick Reference

All 49 descriptors in Scry's grid, by group, with the sensory channels that usually feed them (Chapter 7).

Group	Descriptors	Fed by
Water and Maritime Presence	Water Present · Ocean / Sea · River / Canal / Waterfall · Coastal / Shoreline · Island / Surrounded · Purely Landlocked / Dry	Sound, smell, temperature, motion

Group	Descriptors	Fed by
Terrain and Environment	Desert / Arid Dunes · Mountains / High Elevation · Canyon / Ravine / Gorge · Valley / Plain · Lush Forest / Tropical · Urban / Dense Cityscape · Vertical Cliffs / Precipice	Ideogram, dimension, temperature
Structure Type and Archetype	Tower / Spire / Minaret · Bridge / Spanning Arch · Pyramidal / Ziggurat · Temple / Cathedral / Sacred · Dome / Rotunda / Cupola · Amphitheater / Arena / Oval · Colossal Statue / Figure · Fortress / Wall / Bastion · Pure Natural Formation · Modern Skyscraper / High-Tech	Ideogram, dimension (watch for AOL)
Geometry and Dominant Lines	Triangular / Pointed · Arched / Vaulted · Curved / Circular / Spherical · Linear / Long Horizontal · Extreme Vertical Ascent · Tiered / Stepped Terraces · Asymmetric / Irregular	Ideogram, dimension
Substances and Materials	Hewn Stone / Masonry · Iron / Steel / Metal · Polished Marble / White Stone · Sandstone / Red Earth / Rock · Glass / Reflective Paneling · Snow / Ice / Frozen · Raw Soil / Terracotta / Clay	Texture, temperature, light
Colour Impressions	Golden / Amber / Sand · Red / Terracotta / Russet · Deep Blue / Azure / Teal · Pure White / Pale Alabaster · Granite Grey / Metallic · Emerald / Forest Green · Dark / Charcoal / Shadowy	Colour, light

Group	Descriptors	Fed by
Scale and Atmosphere	Massive / Monumental / Colossal · Serene / Still / Meditative · Ancient / Millennia-Old Aura · Windy / Exposed / High-Altitude · Bustling / Human Convergence · Sacred / Reverent Weight · Remote / Isolated / Silent	Atmosphere, sound, motion, dimension

Appendix B: Session Log Template

Copy this page into your notebook, or print it, for sessions you want to record on paper as well as in the app.

Field	Entry
Date and time	
Coordinate code	
Tier (T1 / T2 / T3)	
Technique	
Meditation minutes	
Sound preset	
Ideogram: motion word and kind word	
Temperature	
Texture	
Sound	
Smell and taste	
Light and colour	
Dimension and motion	
Atmosphere / aesthetic impact	

Field	Entry
AOLs declared (and what each carried)	
Descriptors chosen	
Judge Mode: hit or decoy	
Match score	
Self-rating (Yes / Partially / No)	
Reflection	
Linked dream	

Appendix C: Scry Achievements

Scry's eighteen badges, grouped by category, with the rarity each carries: initiate, adept, master or luminary.

Badge	Category	How to earn it	Rarity
First Light	Milestones	Complete your first session	Initiate
Signal Attunement	Milestones	Complete 5 sessions	Initiate
Deca-Perceiver	Milestones	Complete 10 sessions	Adept
Master Scryer	Milestones	Complete 25 sessions	Master
The Century Horizon	Milestones	Complete 50 sessions	Luminary
Harmonic Cadence	Streaks	View 3 days in a row	Initiate
Consecutive 5-Day Streak	Streaks	View 5 days in a row	Adept
Solar Octave	Streaks	View 7 days in a row	Master
Fortnight Alignment	Streaks	View 14 days in a row	Luminary
Resonance Surge	Accuracy	Reach a 70% match score in one session	Adept

Badge	Category	How to earn it	Rarity
Holographic Fidelity	Accuracy	Reach an 85% match score in one session	Luminary
Canonical Resonance	Accuracy	Rate 5 sessions "Yes"	Adept
Decoy Breaker	Accuracy	Score your first Judge Mode hit	Initiate
Tri-Judge Superiority	Accuracy	Score 3 Judge Mode hits	Master
Dimensional Cartographer	Protocol	View targets in all 3 tiers	Adept
Ideogram Kinematics	Protocol	Sketch ideograms in 3 sessions	Initiate
Oneiric Precognition	Protocol	Link a dream to a session	Adept
Synchronized Mind	Protocol	Complete a Daily Target	Initiate

Appendix D: Glossary

Term	Meaning
Aesthetic impact (AI)	A sudden emotional wave in response to a target, such as awe or fear
Analytical overlay (AOL)	A name or complete image the thinking mind supplies; usually wrong, often carrying real qualities
AOL drive	An overlay that keeps returning and crowds out other impressions
Astral projection	The experience of awareness travelling outside the physical body; also called an OBE
Binaural beat	A pulse perceived when slightly different tones play in each ear
Chance baseline	The hit rate expected from pure guessing; 25% in Judge Mode
Coordinate	The random code that stands for a hidden target

Term	Meaning
CRV	Coordinate, later Controlled, Remote Viewing: the staged protocol taught in this book
Daily Target	One shared coordinate given to all Scry users each day
Decoy	One of the three wrong photographs in Judge Mode
Displacement	Perceiving the feedback, or another nearby time or place, instead of the target itself
Double-blind	No one who can influence the viewer knows the target
Gnosis	Direct, experiential knowing, as opposed to belief
Hypnagogic state	The drowsy border between waking and sleep, rich in imagery
Ideogram	The fast, reflexive first mark made on meeting the coordinate
Judge Mode	Choosing the real target from four photographs using only your record
Lucid dream	A dream in which you know you are dreaming
Match score	Scry's percentage comparing your descriptors with the target's tags
Near-death experience (NDE)	Vivid experiences reported by some people who come close to death
Peer AOL	Overlay caused by hearing other viewers' impressions
Self-rating	Your own honest verdict on a session: Yes, Partially or No
Stage 1 / Stage 2	The ideogram stage and the sensory description stage of CRV
Target	The hidden place a coordinate stands for

Term	Meaning
Tier	Target difficulty: T1 Famous, T2 Obscure, T3 Vectors
Viewing Circle	A group session in which several viewers work the same hidden target

About the Author

Malychite is a Wiccan minister and an elder in the Priesthood of DCWA, and has been a teacher of the Craft for more than thirty years. He teaches Hermeticism with a touch of Gnosis, and trained in astral travel as part of his own initiation into the priesthood. He created the Scry training app so that seekers could test the inner eye under honest, blind conditions, and wrote this book to walk beside it.

Also by Malychite

The Gay Grimoire: The Gay Man's Book of Spells for Every Stage of Life (2016). Spells, rituals, correspondences and guidance for gay pagan men, from coming out to the golden years. Available in paperback and Kindle editions.
